TECHNICAL EIA GUIDANCE MANUAL FOR THERMAL POWER PLANTS

Prepared for
The Ministry of Environment and Forests
Government of India

by
IL&FS Ecosmart Limited
Hyderabad

August 2010

PROJECT TEAM

Project Coordination	Dr. Nalini Bhat Advisor, Ministry of Environment and Forests
Ministry of Environment & Forests	Dr. T. Chandni Director, Ministry of Environment and Forests
Core Project Coordination Team	Mr. Mahesh Babu CEO
IL&FS Environment	Mr. N. Sateesh Babu Vice President & Project Director
	Mr. B.S.V. Pavan Gopal Manager –Technical
	Mr. Padmanabhachar. K Environmental Engineer
	Ms. Suman Benedicta Thomas Technical Writer
Resource Person	Dr. A. L. Aggarwal Former Dy. Director, NEERI and In charge of EIA Division
Expert Committee	
Chairman	Dr. V. Rajagopalan, IAS Additional Secretary Ministry of Chemicals & Fertilizers
Core Members	Dr. R. K. Garg Former Chairman, EIA Committee, Ministry of Environment and Forests
	Mr. Paritosh C. Tyagi Former Chairman, Central Pollution Control Board
	Prof. S.P. Gautam Chairman, Central Pollution Control Board
	Dr. Tapan Chakraborti Director, National Environmental Engineering Research Institute
	Mr. K. P. Nyati Former Head, Environmental Policy, Confederation of Indian Industry
	Dr. G.K. Pandey Former Advisor, Ministry of Environment and Forests
	Dr. Nalini Bhat Advisor, Ministry of Environment and Forests
	Dr. G.V. Subramaniam Advisor, Ministry of Environment and Forests
	Dr. B. Sengupta Former Member Secretary, Central Pollution Control Board
	Dr. R. C. Trivedi Former Scientist, Central Pollution Control Board
Member Convener	Mr. N. Sateesh Babu Project Director

TABLE OF CONTENTS

1. INTRODUCTION TO THE TECHNICAL EIA GUIDANCE MANUALS PROJECT	1-1
1.1 Purpose	1-2
1.2 Project Implementation	1-4
1.3 Additional Information.....	1-4
2. CONCEPTUAL FACETS OF EIA.....	2-1
2.1 Environment in EIA Context.....	2-1
2.2 Pollution Control Strategies	2-2
2.3 Tools for Preventive Environmental Management.....	2-2
2.3.1 Tools for assessment and analysis	2-3
2.3.2 Tools for action.....	2-5
2.3.3 Tools for communication.....	2-10
2.4 Objectives of EIA.....	2-10
2.5 Types of EIA	2-11
2.6 Basic EIA Principles	2-12
2.7 Project Cycle	2-13
2.8 Environmental Impacts	2-13
2.8.1 Direct impacts.....	2-14
2.8.2 Indirect impacts	2-14
2.8.3 Cumulative impacts	2-15
2.8.4 Induced impacts.....	2-15
2.9 Significance of Impacts.....	2-16
2.9.1 Criteria/methodology to determine the significance of the identified impacts....	2-17
3. ABOUT THERMAL POWER PLANTS INCLUDING PROCESS AND POLLUTION CONTROL TECHNOLOGIES.....	3-1
3.1 Introduction to the Industry	3-1
3.1.1 National power scenario	3-3
3.1.2 Fuel quality & availability.....	3-4
3.1.3 Oil and natural gas	3-6
3.1.4 Thermal power generation-capacity addition	3-7
3.1.5 Power generation technology	3-8
3.2 Scientific Aspects of Industrial Process	3-8
3.2.1 Industrial processes in the context of environmental pollution	3-8
3.2.2 Power generation technology options.....	3-12
3.2.3 Environmental impacts of power plants	3-16
3.2.4 Qualitative and quantitative analysis of rejects	3-20
3.2.5 Exposure pathways	3-28
3.3 Technological Aspects	3-30
3.3.1 Cleaner technologies.....	3-30
3.3.2 Pollution control technologies	3-34
3.4 Risk Potential & Quantitative Risk Assessment	3-36

3.4.1	Performing QRA.....	3-36
3.4.2	Hazard identification	3-37
3.4.3	Fire explosion and toxicity index approach.....	3-39
3.4.4	Hazard assessment and evaluation.....	3-40
3.4.5	Failure mode analysis: fault tree analysis.....	3-40
3.4.6	Preliminary hazard analysis.....	3-42
3.4.7	Safety measures	3-45
3.4.8	Damage criteria.....	3-46
3.4.9	Consequence analysis	3-50
3.4.10	Risk management	3-50
3.5	Summary of Applicable National Regulations.....	3-51
3.5.1	General description of major statutes	3-51
3.5.2	General standards for discharge of environmental pollutants	3-51
3.5.3	Industry-specific requirements	3-51
3.5.4	Pending and proposed regulatory requirements	3-52
4.	OPERATIONAL ASPECTS OF EIA.....	4-1
4.1	Coverage of TPP Under the Purview of Notification.....	4-1
4.2	Screening.....	4-6
4.2.1	Applicable conditions for Category B projects	4-6
4.2.2	Criteria for classification of Category B1 and B2 projects.....	4-6
4.2.3	Application for prior environmental clearance.....	4-7
4.2.4	Siting guidelines	4-7
4.3	Scoping for EIA Studies.....	4-9
4.3.1	Pre-feasibility report.....	4-11
4.3.2	Guidance for Providing Information in Form 1	4-12
4.3.3	Identification of appropriate valued environmental components	4-12
4.3.4	Methods for identification of impacts.....	4-12
4.3.5	Testing the significance of impacts	4-18
4.3.6	Terms of reference for EIA studies	4-18
4.4	Environmental Impact Assessment	4-23
4.4.1	EIA team.....	4-24
4.4.2	Baseline quality of the environment.....	4-25
4.4.3	Impact prediction tools	4-28
4.4.4	Significance of the impacts.....	4-28
4.5	Social Impact Assessment.....	4-29
4.6	Risk Assessment.....	4-31
4.6.1	Disaster management plan.....	4-35
4.7	Mitigation Measures.....	4-38
4.7.1	Important considerations for mitigation methods.....	4-38
4.7.2	Hierarchy of elements of mitigation plan	4-39
4.7.3	Typical mitigation measures.....	4-40
4.7.4	Mitigation Measure on Special Environmental Issues	4-44
4.8	Environmental Management Plan	4-47
4.9	Reporting.....	4-48
4.10	Public Consultation	4-50
4.11	Appraisal	4-53

Table of Contents

4.12	Decision-Making.....	4-55
4.13	Post-Clearance Monitoring Protocol.....	4-56
5.	STAKEHOLDERS' ROLES AND RESPONSIBILITIES	5-1
5.1	SEIAA.....	5-3
5.2	EAC and SEAC.....	5-6

LIST OF TABLES

Table 3-1: Indicators of Energy and Electricity Use in Various Countries	3-4
Table 3-2: Coal Supply Position for Utility TPPs.....	3-5
Table 3-3: Supply of Gas to Power Plants	3-7
Table 3-4: Power Generation Capacity	3-7
Table 3-5: Emissions from Steam Cycle TPPs	3-10
Table 3-6: Emissions from Gas Turbine	3-12
Table 3-7: Comparison of Different Technologies and Status of their Development in India	3-14
Table 3-8: Potential Emissions from a TPP	3-18
Table 3-9: Potential Ranges of Pollutant Concentration Levels in Untreated Gas Type of Fuel.....	3-20
Table 3-10: Exposure Pathways.....	3-28
Table 3-11: Comparison of Clean Power Technologies	3-32

LIST OF ANNEXURES

Annexure I

Mercury Emission Status and Control Technology

Annexure II

A Compilation of Legal Instruments

Annexure III

General Standards for Discharge of Environmental Pollutants as per CPCB

Annexure IV

Environmental Standards for Liquid Effluents from Thermal Power Plants

Annexure V

Utilization of Ash by Thermal Power Plants

Annexure VI

MoEF Notification S.O. 513 (E) – Utilization of Fly Ash

Annexure VII

Form 1 (Application Form for EIA Clearance)

Annexure VIII

Critically Polluted Industrial Areas and Clusters/Potential Impact Zone

Annexure IX

Pre-Feasibility Report: Additional Points for Possible coverage

Annexure X

Types of Monitoring and Network Design Considerations

Annexure XI

Guidance for Assessment of Baseline Components and Attributes

Annexure XII

Sources of Secondary Data Collection

Annexure XIII

Impact Prediction Models

Annexure XIV

Form through which the State Governments/Administration of the Union Territories Submit Nominations for SEIAA and SEAC for the Consideration and Notification by the Central Government

Annexure XV

Composition of EAC/SEAC

Annexure XVI

Best Practices & Latest Technologies available and reference

ACRONYMS

AFBC	Atmospheric Fluidised Bed Combustor
B/C	Benefits Cost Ratio
BIS	Bureau of Indian Standards
BOD	Biological Oxygen Demand
BOQ	Bill of Quantities
BOT	Built-Operate-Transfer
BLEVE	(Boiling Liquid Expanding Vapour Cloud) or Vapour Cloud Explosion
BTEX	Benzene, Ethyl benzene, Toluene, and Xylenes
CCA	Conventional Cost Accounting
CEA	Central Electricity Authority
CEAA	Canadian Environmental Assessment Agency
CER	Corporate Environmental Reports
CETP	Common Effluent Treatment Plant
CFBC	Circulating Fluidized-bed Combustion
CFE	Consent for Establishment
COD	Chemical Oxygen Demand
CP	Cleaner Production
CPCB	Central Pollution Control Board
CRZ	Coastal Regulatory Zone
CSR	Corporate Social Responsibility
CST	Central Sales Tax
DA	Development Authorities
DC	Drill cuttings
DfE	Design for Environment
DMS	Dense Medium Separation
DO	Dissolved Oxygen
EAC	Expert Appraisal Committee
EBM	Environmental Baseline Monitoring
EcE	Economic-cum-Environmental
ECI	Environmental Condition Indicators
EHS	Environment Health and Safety
EIA	Environmental Impact Assessment
EIS	Environmental Information system
EPA	Environmental Protection Agency
EPI	Environmental Performance Indicators
EPR	Extended Producers Responsibilities

EMA	Environmental Management Accounting
EMS	Environmental Management System
EMP	Environmental Management Plan
ERPC	Environment Research and Protection Centre
ETP	Effluent Treatment Plant
FCA	Full Cost Assessment
FE&TI	Fire-Explosion and Toxicity Index
FF	Fabric Filters
GLC	Ground-level Concentration
GW	Giga Watt
HTL	High Tide Line
IL&FS	Infrastructure Leasing and Financial Services
ILO	International Labour Organization
IMD	India Meteorological Department
IT	Information Technology
IVI	Importance Value Index
ISO	International Standard Organization
JV	Joint Venture
kCal	Kilo Calories
kWh	Kilo Watt Hour
km	Kilometre
LANDSAT	Land Remote Sensing Satellite / Land Use Satellite
LDAR	Leak Detection and Repair
LCA	Life Cycle Assessment
LEL	Lower Explosive Limit
LNG	Liquefied Natural Gas
LTL	Low Tide Level
MCA	Maximum Credible Accident
MoEF	Ministry of Environment & Forests
MSW	Municipal Solid Waste
NAQM	National Air Quality Monitoring
NGO	Non-Government Organizations
NOC	No Objection Certificate
OCD	Offshore and Coastal Dispersion Model
OECD	Organization for Economic Co-operation and Development
OSHA	Occupational Safety and Health Administration
PAH	Polycyclic Aromatic Hydrocarbons
PCC	Pollution Control Committee
PPV	Peak Particle Velocity

R&D	Research and Development
R&R	Resettlement and Rehabilitation
RPM	Respirable Particulate Matter
RSPM	Respirable Suspended Particulate Matter
QA/QC	Quality Assurance/Quality Control
QRA	Quantitative Risk Assessment
SEAC	State Level Expert Appraisal Committee
SEIAA	State Level Environment Impact Assessment Authority
SEZ	Special Economic Zone
SPCB	State Pollution Control Board
SPM	Suspended Particulate Matter
SS	Suspended Solids
TA	Technology Assessment
TCA	Total Cost Assessment
TDS	Total Dissolved Solids
TEQM	Total Environmental Quality Movement
TGM	Technical EIA Guidance Manuals
toe	Tonne Oil Equivalent
TPES	Total Primary Energy Supply
TPP	Thermal Power Plant
TSDF	Treatment Storage Disposal Facility
TSS	Total Suspended Solids
UNEP	United Nations Environmental Programme
USEPA	United States Environment Protection Agency's
UT	Union Territory
UTEIAA	Union Territory Level Environment Impact Assessment Authority
UTPCC	Union Territory Pollution Control Committee
VOC	Volatile Organic Compound
VEC	Valued Environmental Components
WB	World Bank Group / The World bank
WBCSD	World Business Council on Sustainable Development
WBDF	Water-based Drilling Fluids

Mahesh Babu
Chief Executive Officer

Acknowledgement

The Notification issued on the prior environmental clearance process by the Ministry of Environment and Forests (MoEF) on September 14, 2006 delegated substantial powers to the State Level Environment Impact Assessment Authorities (SEIAA) to grant environmental clearance for certain categories of developmental activities/projects. It was felt that proper guidance to the stakeholders would enhance appreciation of environmental impacts of proposed projects and possible mitigation measures. Further, such a guidance would also help ensure that decision making authorities across different States and Union Territories could adopt similar considerations and norms with due weightage for site-specific considerations.

We feel privileged to be part of the interventions being spearheaded by Sh. Jairam Ramesh, Hon'ble Minister, MoEF, Government of India, to mainstream environmental considerations in the decision making process. IL&FS Ecosmart as part of this important initiative, prepared Technical EIA Guidance Manuals for 27 identified development activities. In view of the diversity of 27 developmental activities entrusted to IL&FS Ecosmart Ltd., in consultation with the MoEF, an expert Peer and Core Committee was constituted to review and finalize each of the draft Manuals. The Manuals prepared by IL&FS were technically reviewed and up-dated by the respective sector-specific expert resource persons.

The Manuals designed by the Expert Committee have benefitted from the advise and feedback received from MoEF. The Manuals are designed to provide readers with an in-depth understanding of the environmental clearance mechanism, developmental activity specific environmental impacts with possible mitigation measures, environmentally compliant manufacturing/ production processes and pollution control technologies, etc.

IL&FS Ecosmart hopes that these Manuals are a step forward to realize the MoEF's desired objective of enhancing functional efficiency and effectiveness in the environmental clearance process. We hope the stakeholders will find the Manuals useful.

We take this opportunity to convey our appreciation to the MoEF team under the leadership of Mr. J.M. Mauskar, Additional Secretary, for the technical inputs, guidance and support extended throughout the project period for successful completion of the project. The technical guidance and support extended by the Expert Peer and Core Committee under the Chairmanship of Dr. V. Rajagopalan, former Chairman, Central Pollution Control Board and inputs of the sector-specific resource persons are gratefully acknowledged.

(Mahesh Babu)

15th November 2010

22nd December 2010

FOREWORD

The Ministry of Environment & Forests (MOEF) introduced the Environmental Impact Assessment (EIA) Notification 2006 on 14th September 2006, which not only reengineered the entire environment clearance (EC) process specified under the EIA Notification 1994, but also introduced a number of new developmental sectors which would require prior environmental clearance. The EIA Notification 2006 has notified a list of 39 developmental sectors which have been further categorised as A or B based on their capacity and likely environmental impacts. Category B projects have been further categorised as B1 and B2. The EIA Notification 2006 has further introduced a system of screening, scoping and appraisal and for the setting up of Environment Impact Assessment Authority (EIAA) at the Central level and State Level Environment Impact Assessment Authorities (SEIAAs) to grant environmental clearances at the Central and State level respectively. The Ministry of Environment & Forests is the Environment Impact Assessment Authority at the Central level and 25 State Level Environment Impact Assessment Authorities (SEIAAS) have been set up in the various States/UTs. The EIA Notification 2006 also stipulates the constitution of a multi-disciplinary Expert Appraisal Committee (EAC) at the Centre and State level Expert Appraisal Committees (SEACs) at State/UT Level for appraisal of Category A or B projects respectively and to recommend grant/rejection of environmental clearance to each project/activities falling under the various sectors to the EIAA/SEIAAs respectively.

Although the process of obtaining environmental clearance consisting of Screening, Scoping and Appraisal and for undertaking public consultation including the process of conduct of Public Hearing has been elaborated under the EIA Notification 2006, the Notification itself provides for bringing out guidelines from time to time on the EIA Notification 2006 and the EC process with a view to bringing clarity on the EC process for expediting environmental clearance. This need was further reinforced after the constitution of SEIAAs and SEACs in various States, who were assigned the task for the first time and for addressing the concerns of standardization of the quality of appraisal and in reducing inconsistencies between SEACs/SEIAAs in granting ECs for similar projects in different States.

The Technical Guidance Manual of "Thermal Power Plants" sector describes types of EIA, process and pollution control technologies, operational aspects of EIA with model TOR of that Sector, technological options with cleaner production and waste minimization techniques,

monitoring of environmental quality, post clearance monitoring protocol, related regulations, and procedure of obtaining EC if linked to other clearances for e.g., CRZ, etc.

Power plants are part of the energy sector and it is essential that these power plant facilities are constructed to achieve a high level of reliability and efficiency. Moreover, it is for the companies involved in this industry to contribute to society by achieving higher performance at lower cost and use of cleaner technologies. Solar thermal power generation can be combined with conventional thermal power plants to reduce dependency on coal. Combined utilization leads to substantial cost reductions and thus facilitates entry into the use of renewable energies. India's industrial competitiveness and environmental future depends on Industries such as Thermal Power Plants adopting energy and resource efficient technologies. Recycling and reuse of materials is critical.

To keep pace with changing technologies and needs of sustainable development, the manual would require regular updating in the future. The manual will be available on the MoEF website and we would appreciate receiving responses from stakeholders for further improvements.

I congratulate the entire team of IL&FS Ecosmart Ltd., experts from the sector who were involved in the preparation of the Manuals, Chairman and members of the Core and Peer Committees of various sectors and various Resource Persons whose inputs were indeed valuable in the preparation and finalization of the Manuals.

(Jairam Ramesh)

1. INTRODUCTION TO THE TECHNICAL EIA GUIDANCE MANUALS PROJECT

Environmental Impact Assessment (EIA) is a process of identifying, predicting, evaluating and mitigating the biophysical, social, and other relevant effects of development proposals prior to major decisions being taken and commitments made. These studies integrate the environmental concerns of developmental activities into the process of decision-making.

EIA has emerged as one of the successful policy innovations of the 20th Century to ensure sustained development. Today, EIA is formalized as a regulatory tool in more than 100 countries for effective integration of environmental concerns with the economic development process. The EIA process in India was made mandatory and was also given a legislative status through a Notification issued by the Ministry of Environment and Forests (MoEF) in January 1994. The Notification, however, covered only a few selected industrial developmental activities. While there are subsequent amendments, the Notification issued on September 14, 2006 supersedes all the earlier Notifications, and has brought out structural changes in the clearance mechanism.

The basic tenets of this EIA Notification could be summarized into following:

- Pollution potential as the basis for prior environmental clearance instead of investment criteria; and
- Decentralization of clearing powers to the State/Union Territory (UT) level Authorities for certain developmental activities to make the prior environmental clearance process quicker, transparent and effective mechanism of clearance.

Devolution of the power to grant clearances at the state-level for certain categories of the developmental activities / projects would fulfill the basic tenets of the re-engineering process *i.e.*, quicker, transparent and effective process but many issues impede/hinder its functional efficiency. These issues could be in technical and operational as listed below:

Technical Issues

- Ensuring level playing ground to avoid arbitrariness in the decision-making process
- Classification of projects which do not require public hearing and detailed EIA (Category B2)
- Variations in drawing the Terms of Reference (ToR) for EIA studies for a given developmental activity across the States/UTs
- Varying developmental-activity-specific expertise requirement for conducting EIA studies and their appraisal
- Availability of adequate sectoral experts and variations in competency levels
- Inadequate data verification, cross checking tools and supporting institutional framework
- Meeting time targets without compromising with the quality of assessments/ reviews

- Varying knowledge and skill levels of regulators, consultants and experts
- Newly added developmental activities for prior environmental clearance, *etc.*

Operational Issues

- State level /UT level EIA Authorities (SEIAA/UTEIAA) are formulated for the first time and many are functioning
- Varying roles and responsibilities of involved organizations
- Varying supporting institutional strengths across the States/UTs
- Varying manpower availability *etc.*

1.1 Purpose

The purpose of developing these sector-specific technical EIA guidance manuals (TGM) is to provide clear and concise information on EIA to all the stakeholders *i.e.*, the project proponent, the consultant, the reviewer, and the public. The TGMs are organized to cover the following:

Chapter 1 (Introduction): This chapter provides a brief introduction on the EIA, basic tenets of EIA Notification, technical & operational issues in the process of clearance, purpose of the TGMs, project implementation process and additional information.

Chapter 2 (Conceptual facets of an EIA): Provides an overall understanding to the conceptual aspects of control of pollution and EIA for the developmental projects. This basic understanding would set the readers at same level of understanding for proper interpretations and boundaries for identifying the environmental interactions of the developmental projects and their significance for taking measures of mitigation. This chapter covers the discussion on environment in EIA context *i.e* sustainable development, pollution control strategies, preventive environmental management tools, Objectives of EIA, types and basic principles of EIA, project cycle for Thermal power plant, understanding on type of environmental impacts and the criteria for the significance analysis.

Chapter 3 (Thermal Power Plant): The purpose of this chapter is to provide the reader precise information on all the relevant aspects of the industry, which is essential to realize the likely interaction of such developmental activities on the receiving environment. Besides, this Chapter gives a holistic understanding on the sources of pollution and the opportunities of the source control.

The specific coverage which provides precise information on the industry include (i) Introduction to the Industry -National power scenario, Fuel quality & availability, Oil and natural gas, Thermal power generation-capacity addition, Power generation technology, (ii) Scientific Aspects of Industrial Process - Industrial processes in the context of environmental pollution, Power generation technology options, Environmental impacts of power plants, Qualitative and quantitative analysis of rejects, Exposure pathways, (iii) Technological Aspects- Cleaner technologies, Pollution control technologies, (iv) Risk Potential & Quantitative Risk Assessment - Performing QRA, Hazard identification, Fire explosion and toxicity index approach, Hazard assessment and evaluation, Failure mode analysis: fault tree analysis, Preliminary hazard analysis, Safety measures, Damage criteria, Consequence analysis, Risk management, and (v) Summary of Applicable National Regulations - General description of major statutes, General standards for

discharge of environmental pollutants, Industry-specific requirements, Pending and proposed regulatory requirements.

Chapter 4 (Operational aspects): The purpose of this chapter is to facilitate the stakeholders to extend clear guidance on coverage of legislative requirements, sequence of procedures for obtaining the EIA clearance and each step-wise provisions and considerations.

The coverage of the Chapter include provisions in the EIA Notification regarding proposed industry, screening (criteria for categorization of B1 and B2, siting guidelines, *etc.*), scoping (pre-feasibility report, guidance for filling form 1, identification of valued environmental components, identification of impacts, *etc.*), arriving at terms of reference for EIA studies, impact assessment studies (EIA team, assessment of baseline quality of environment, impact prediction tools, significance of impacts), social impact assessment, risk assessment considerations, typical mitigation measures, designing considerations for environmental management plan, structure of EIA report for incorporation of study findings, process of public consultation, project appraisal, decision making process and post-clearance monitoring protocol.

Chapter 5 (Roles and responsibilities of various organizations involved in the process of prior environmental clearance): The purpose of this Chapter is to brief the stakeholders on the institutional mechanism and roles & responsibilities of the stakeholders involved in the process of prior environmental clearance. The Coverage of the Chapter include (i) roles and responsibilities of the stakeholders, (ii) organization specific functions, (iii) constitution, composition and decision making process of SEIAA and (iv) EAC & SEAC and (v) other conditions which may be considered

For any given industry, each topic listed above could alone be the subject of a lengthy volume. However, in order to produce a manageable document, this project focuses on providing summary information for each topic. This format provides the reader with a synopsis of each issue. Text within each section was researched from many sources, and was condensed from more detailed sources pertaining to specific topics.

The contents of the document are designed with a view to facilitate addressing of relevant technical and operational issues as mentioned in the earlier section. Besides, facilitates various stakeholders involved in the process of EIA clearance process.

- Project proponent will be fully aware of the procedures, common ToR for EIA studies, timelines, monitoring needs, *etc.*, in order to plan the projects/ studies appropriately.
- Consultants across India will have similar understanding about a given sector, and also the procedure for conducting the EIA studies, so that the quality of the EIA reports gets improved and streamlined
- Reviewers across the States/UTs will have the same understanding about an industrial sector and would able to draw a benchmark in establishing the significant impacts for the purpose of prescribing the ToR for EIA studies and also in the process of review and appraisal.
- Public who are concerned about new or expansion projects, use this manual to get a basic idea about the manufacturing/production details, rejects/wastes from the operations, choice of cleaner/ control technologies, regulatory requirements, likely environmental and social concerns, mitigation measures, *etc.* in order to seek clarifications appropriately in the process of public consultation. The procedural

clarity in the document will further strengthen them to understand the stages involved in clearance and roles and responsibilities of various organizations.

- In addition, these manuals would substantially ease the pressure on reviewers at the scoping stage and would bring in functional efficiency at the central and state levels.

1.2 Project Implementation

The Ministry of Environment & Forests (MoEF), Government of India took up the task of developing sector-specific TGMs for all the developmental activities listed in the re-engineered EIA Notification. Infrastructure Leasing and Financial Services Ecosmart Limited (IL&FS Ecosmart), has been entrusted with the task of developing these manuals for 27 industrial and related sectors. Thermal Power Plant (TPP) is one of these sectors, for which this manual is prepared.

The ability to design comprehensive EIA studies for specific industries depends on the knowledge of several interrelated topics. Therefore, it requires expert inputs from multiple dimensions *i.e.*, administrative, project management, technical, scientific, social, economic risks *etc.*, in order to comprehensively analyze the issues of concern and to logical interpretations. Thus, Ecosmart has designed a well-composed implementation framework has been designed to factor inputs of the experts and stakeholders in the process of finalization of these manuals.

The process of manual preparation involved collection & collation of the secondary available information, technical review by sectoral resource persons and critical review & finalization by a competent Expert Committee composed of core and sectoral peer members.

The MoEF appreciates the efforts of Ecosmart, Expert Core and Peer Committee, resource persons and all those who have directly and indirectly contributed to this Manual.

1.3 Additional Information

This TGM is brought out by the MoEF to provide clarity to all the stakeholders involved in the 'prior environmental clearance' process. As such, the contents and clarifications given in this document do not withstand in case of a conflict with the statutory provisions of the Notifications and Executive Orders issued by the MoEF from time-to-time.

TGMs are not regulatory documents. Instead these are the tools designed to assist successful completion of an EIA.

For the purposes of this project, the key elements considered under TGMs are: conceptual aspects of EIA; developmental activity-specific information; operational aspects; and roles and responsibilities of involved stakeholders.

This manual is prepared considering the Notification issued on September 14, 2006 and latest amendment as on 1st December 2009. For recent updates, if any, may please refer the website of the MoEF, Government of India *i.e.* <http://moef.nic.in/index.php>.

2.

CONCEPTUAL FACETS OF EIA

It is an imperative requirement to understand the basic concepts concerned to the pollution control and the environmental impact assessment in an overall objective of the sustainable development. This Chapter highlights the pollution control strategies and their tools besides the objectives, types & principles of EIA, type of impacts their significance analysis, in order to provide consistent understanding to the reader before assessing the development of activity-specific environmental concerns in Chapter 3 and identification & prediction of significant impacts in order to design mitigation measures as detailed in Chapter 4.

2.1 Environment in EIA Context

“Environment” in EIA context mainly focuses, but is not limited to physical, chemical, biological, geological, social, economical, and aesthetic dimensions along with their complex interactions, which affects individuals, communities and ultimately determines their forms, character, relationship, and survival. In EIA context, ‘effect’ and ‘impact’ can often be used interchangeably. However, ‘impact’ is considered as a value judgment of the significance of an effect.

Sustainable development is built on three basic premises *i.e.*, economic growth, ecological balance and social progress. Economic growth achieved in a way that does not consider, the environmental concerns, will not sustain in the long run. Therefore, sustainable development needs careful integration of environmental, economic, and social needs in order to achieve both an increased standard of living in short term, and a net gain or equilibrium among human, natural, and economic resources to support future generations in the long term.

“It is necessary to understand the links between environment and development in order to make choices for development that will be economically efficient, socially equitable and responsible, as well as environmentally sound.” Agenda 21

Figure 2-1: Inclusive Components of Sustainable Development

2.2 Pollution Control Strategies

Pollution control strategies can be broadly categorized into preventive and reactive. The reactive strategy refers to the steps that may be applied once the wastes are generated or contamination of the receiving environment takes place. The control technology or a combination of technologies to minimize the impact due to process rejects/wastes varies with quantity and characteristics desired control efficiency and economics.

Many combinations of techniques could be adopted for treatment of a specific waste or the contaminated receiving environment, but are often judged based on techno-economic feasibility. Therefore, the best alternative is to take all possible steps to avoid pollution itself. This preventive approach refers to a hierarchy that involves: i) prevention & reduction; ii) recycling and re-use; iii) treatment; and iv) disposal, respectively.

Therefore, there is a need to shift the emphasis from the reactive to preventive strategy *i.e.*, to promote preventive environmental management. Preventive environmental management tools may be grouped into management based tools, process based tools and product based tools. A few of them are given below:

Management Based Tools	Process Based Tools	Product Based Tools
Environmental Management System (EMS)	Environmental Technology Assessment	Industrial Ecology
Environmental Performance Evaluation	Toxic Use Reduction	Extended Producers Responsibility
Environmental Audits	Best Operating Practices	Eco-labeling
Environmental Reporting and Communication	Environmentally Best Practice	Design for Environment
Total Cost Accounting	Best Available Technology (BAT)	Life Cycle Assessment (LCA)
Law and Policy	Waste Minimization	
Trade and Environment	Pollution Prevention	
Environmental Economics	Cleaner Production	
	4-R Concept	
	Cleaner Technology	
	Eco-efficiency	

2.3 Tools for Preventive Environmental Management

The tools for preventive environmental management can be broadly classified into following three groups *i.e.*,

- Tools for assessment and analysis - risk assessment, life cycle assessment, total cost assessment, environmental audit / statement, environmental benchmarking, environmental indicators
- Tools for action - environmental policy, market based economic instruments, innovative funding mechanism, EMS and ISO certification, total environmental quality movement, eco-labeling, cleaner production, eco-efficiency, industrial ecosystem or metabolism, voluntary agreements
- Tools for communication - state of environment, corporate environmental reporting

Specific tools under each group are discussed precisely in next sections.

2.3.1 Tools for assessment and analysis

2.3.1.1 Risk assessment

Risk is associated with the frequency of failure and consequence effect. Predicting such situations and evaluation of risk is essential to take appropriate preventive measures. The major concern of the assessment is to identify the activities falling in a matrix of high & low frequencies at which the failures occur and the degree of its impact. The high frequency, low impact activities can be managed by regular maintenance *i.e.*, Leak detection and repair (LDAR) programmes. Whereas, the low frequency, high impact activities (accidents) are of major concern in terms of risk assessment. As the frequency is low, often the required precautions are not realized or maintained. However, the risk assessment identifies the areas of major concerns which require additional preventive measures, likely consequence distances considering domino effects, which will give the possible casualties and ecological loss in case of accidents. These magnitudes demand the attention for preventive and disaster management plans (DMPs). Thus is an essential tool to ensure safety of operations.

2.3.1.2 Life cycle assessment

A broader approach followed to deal with environmental impacts in manufacturing is called LCA. This approach recognizes that environmental concerns are associated with every step of processing w.r.t manufacturing of products and also examines environmental impacts of the product at all stages of product life cycle. LCA includes the project design, development, manufacturing, packaging, distribution, usage and disposal. LCA is concerned with reducing environmental impacts at all stages and considering the total picture rather than just one stage of production process.

Industries/firms may apply this concept to minimize the life cycle environmental costs of their total product system.

2.3.1.3 Total cost assessment

Total Cost Assessment (TCA) is an enhanced financial analysis tool that is used to assess the profitability of alternative courses of action e.g. raw material substitution to reduce the costs of managing the wastes generated by process; an energy retrofit to reduce the costs of energy consumption. This is particularly relevant for pollution prevention options. These options, because of their nature, often produce financial savings that are overlooked in conventional financial analysis, either because they are misallocated, uncertain, hard to quantify, or occur more than three to five years after the initial investment. TCA includes all of relevant costs and savings associated with an option so that it can compete for scarce capital resources fairly, on a level playing field. The assessments are often beneficial w.r.t the following:

- Identification of costly resource inefficiencies
- Financial analysis of environmental activities/projects such as investment in cleaner technologies
- Prioritization of environmental activities/projects
- Evaluation of product mix and product pricing
- Benchmarking against the performance of other processes or against the competitors

A comparison of cost assessments is given below:

- Conventional cost accounting (CCA): Direct and indirect financial costs+ Recognized contingent costs
- Total Cost Assessment (TCA): A broader range of direct, indirect, contingent and less quantifiable costs
- Full Cost assessment (FCA): TCA + External social costs borne by society

2.3.1.4 Environmental audit/statement

Key objectives of an environmental audit include compliance verification, problem identification, environmental impact measurement, environmental performance measurement, conforming effectiveness of EMS, providing a database for corrective actions and future actions, developing company's environmental strategy, communication and formulating environmental policy.

The MoEF, Government of India (GOI) issued Notification on 'Environmental Statements' (ES) in April, 1992 and further amended in April 1993 – As per the Notification, the industries are required to submit environmental statements to the respective State Pollution Control Boards (SPCBs). ES is a proactive tool for self-examination of the industry to reduce/minimize pollution by adopting process modifications, recycling and reusing of the resources. The regular submission of ES will indicate the systematic improvement in environmental pollution control being achieved by the industry. In other way, specific points in ES may be used as environmental performance indicators for relative comparison, implementation and to promote better practices.

2.3.1.5 Environmental benchmarking

Environmental performance and operational indicators could be used to navigate, manage and communicate significant aspects and give enough evidence of good environmental house keeping. Besides the existing prescribed standards, an insight to identify the performance indicators and prescribing schedule for systematic improvement in performance of these indicators will yield better results.

Relative indicators may be identified for different industrial sectors to be integrated in companies and organizations to monitor and manage different environmental aspects of the company, to benchmark and compare two or more companies from the same sector. These could cover water consumption, wastewater generation, energy consumption, solid/hazardous waste generation, chemical consumption, *etc.*, per tonne of final product. Once these benchmarks are developed, the industries which are below the may be guided and enforced to reach them while those which are better than the benchmark may be encouraged further by giving incentives, *etc.*

2.3.1.6 Environmental indicators

Indicators can be classified into environmental performance indicators (EPI) and environmental condition indicators (ECI). The EPIs can be further divided into two categories *i.e.*, operational performance indicators and management performance indicators.

The operational performance indicators are related to the process and other operational activities of the organization. These would typically address the issue of raw material consumption, energy consumption, water consumption in the organization, the quantities

of wastewater generated, other solid wastes & emissions generated from the organization *etc.*

Management performance indicators, on the other hand, are related to management efforts to influence the environmental performance of organisational operations.

The environmental condition indicators provide information about the environment. These indicators provide information about the local, regional, national or global condition of the environment. This information helps an organization to understand the environmental impacts of its activities and thus helps in taking decisions to improve the environmental performance.

Indicators are basically used to evaluate environmental performance against the set standards and thus indicate the direction in which to proceed. Selection of type of indicators for a firm or project depends upon its relevance, clarity and realistic cost of collection and its development.

2.3.2 Tools for action

2.3.2.1 Environmental policy

An environmental policy is a statement of an organization's overall aim and principles of action w.r.t the environment, including compliance with all relevant regulatory requirements. It is a key tool in communicating environmental priorities of the organization to all its employees. To ensure an organization's commitment towards formulated environmental policy, it is essential for the top management to be involved in the process of formulating the policy and setting priorities. Therefore, the first step is to get the commitment from the higher levels of management. The organization should then conduct an initial environmental review and draft an environmental policy. This draft should be discussed and approved by the board of directors. The approved environmental policy statement should then be communicated internally among all its employees and should also be made available to the public.

2.3.2.2 Market-based economic instruments

Market-based instruments are regulations that encourage behavior through market signals rather than through explicit directives regarding pollution control levels. These policy instruments such as tradable permits pollution charge, *etc.*, are often described as harnessing market forces. Market-based instruments can be categorized into the following four major categories, which are discussed below:

- **Pollution charge:** Charge system will assess a fee or tax on the amount of pollution a firm or source generates. It is worthwhile for the firm to reduce emissions to the point, where its marginal abatement cost are equal to the tax rate. Thus the firms control pollution to different degrees *i.e.*, High cost controllers – less; low-cost controllers – more. The charge system encourages the industries to reduce the pollutants further. The charges thus collected can form a fund for restoration of the environment. Another form of pollution charge is a deposit refund system, where, consumers pay a surcharge when purchasing a potentially polluting product, and receive a refund on return of the product after useful life span at appropriate centers. The concept of extended producer's responsibility is brought in to avoid accumulation of dangerous products in the environment.

- **Tradable permits:** Under this system, firms that achieve the emission levels below their allotted level may sell the surplus permits. Similarly, the firms, which are required to spend more to attain the required degree of treatment/allotted levels, can purchase permits from others at lower costs and may be benefited.
- **Market barrier reductions:** Three known market barrier reduction types are as follows:
 - Market creation: Measures and facilitates the voluntary exchange of water rights and thus promote efficient allocation of scarce water supplies
 - Liability concerns: Encourages firms to consider potential environmental damages of their decisions
 - Information programmes: Ecolabeling and energy – efficiency product labeling requirements
- **Government subsidy reduction:** Subsidies are the mirror images of taxes and, in theory, can provide incentives to address environmental problems. However, it has been reported that the subsidies encourage economically inefficient and environmentally unsound practices, and often lead to market distortions due to differences in the area. However, in the national interest, subsidies are important to sustain the expansion of production. In such cases, the subsidy may be comparable to the net social benefit.

2.3.2.3 Innovative funding mechanism

There are many forums under which the fund is made available for the issues which are of global/regional concern (GEF, OECD, Deutch green fund *etc.*) *i.e.*, climate change, Basal Convention and further fund sources are being explored for the Persistent Organic Pollutants Convention. Besides these global funding mechanisms, a localized alternative mechanism for boosting the investment in environmental pollution control must be put in place. For example, in India the Government has established mechanism to fund the common effluent treatment plants, which are specifically serving the small and medium scale enterprises *i.e.*, 25% share by the State Government, matching grants from the Central Government and surety for 25% soft loan. It means that the industries need to invest only 25% initially, thus encouraging voluntary compliance.

There are some more options *i.e.*, if the pollution tax/charge is imposed on the residual pollution being caused by the industries, municipalities, *etc.*, funds will be automatically generated, which in turn, can be utilized for funding the environmental improvement programmes. The emerging concept of build-operate-transfer (BOT) is an encouraging development, where there is a possibility to generate revenue by application of advanced technologies. There are many opportunities which can be explored. However, what is required is the paradigm shift and focused efforts.

2.3.2.4 EMS and ISO certification

EMS is that part of the overall management system, which includes organizational structure, responsibilities, practices, procedures, processes and resources for determining and implementing the forms of overall aims, principles of action w.r.t the environment. It encompasses the totality of organizational, administrative and policy provisions to be taken by a firm to control its environmental influences. Common elements of an EMS are the identification of the environmental impacts and legal obligations, the development of a plan for management & improvement, the assignment of the responsibilities and monitoring of the performance.

2.3.2.5 Total environmental quality movement

Quality is regarded as

- A product attribute that must be set at an acceptable level and balanced against the cost
- Something delivered by technical systems engineered by experts rather than the organization as a whole
- Assured primarily through the findings and correction of mistakes at the end of the production process

One expression of the total environment quality movement (TEQM) is a system of control called Kaizen. The principles of Kaizen are:

- Goal must be continuous improvement of quality instead of acceptable quality
- Responsibility of quality shall be shared by all members of an organization
- Efforts should be focused on improving the whole process and design of products

With some modifications, the TQM approach can be applied in improvement of corporate environmental performance in both process and product areas.

2.3.2.6 Eco-labeling

Eco-labeling is the practice of supplying information on the environmental characteristics of a product or service to the general public. These labeling schemes can be grouped into three types:

- Type I: Multiple criteria base; third party (Govt. or non-commercial private organizations) programme claims overall environmental preferability.
- Type II: Specific attributes of a product; often issued by a company/industrial association
- Type III: Agreed set of indices; provide quantified information; self declaration

Among the above, Type I schemes are more reliable because they are established by a third-party and consider the environmental impacts of a product from cradle to grave. However, the labeling program will only be effective if linked with complementary programme of consumer education and up on restriction of umbrella claims by the producers.

2.3.2.7 Cleaner production

Cleaner production is one of the tools, which influences the environmental pollution control. It is also seen that the approach is changing with time *i.e.*, dumping-to-control-to-recycle-to-prevention. Promotion of cleaner production principles involves an insight into the production processes not only to get desired yield, but also to optimize raw material consumption, *i.e.*, resource conservation and implications of the waste treatment and disposal.

2.3.2.8 4-R concept

The concept endorses utilization of wastes as by-product to the extent possible *i.e.*, Recycle, Recover, Reuse, Recharge. Recycling refers to using wastes/by-products in the process again as a raw material to maximize production. Recovery refers to engineering means such as solvent extraction, distillation, precipitation, *etc.*, to separate useful constituents of wastes, so that these recovered materials can be used. Reuse refers to the utilization of waste from one process as a raw material to other. Recharging is an option in which the natural systems are used for renovation of waste for further use.

2.3.2.9 Eco-efficiency

The World Business Council on Sustainable Development (WBCSD) defines eco-efficiency as “the delivery of competitively priced goods and services that satisfy human needs and bring quality of life, while progressively reducing ecological impacts and resource intensity throughout the life cycle, to a level at least in line with earth’s carrying capacity”. The business implements the eco-efficiency on four levels *i.e.*, optimized processes, recycling of wastes, eco-innovation and new services. Fussler (1995) defined six dimensions of eco-efficiency, which are given below to understand/examine the system.

- Mass: There is an opportunity to significantly reduce mass burdens (raw materials, fuels, utilities consumed during the life cycle)
- Reduce Energy Use: The opportunity is to redesign the product or its use to provide significant energy savings
- Reduce Environmental Toxins: This is a concern to the environmental quality and human health. The opportunity here is to significantly control the dispersion of toxic elements
- Recycle when Practical: Designing for recycling is important
- Working with Mother Nature: Materials are borrowed and returned to the nature without negatively affecting the balance of the ecosystem
- Make it Last Longer: It relates to useful life and functions of products. Increasing the functionality of products also increases their eco-efficiency

The competitiveness among the companies and long-term survival will continue and the successful implementation of eco-efficiency will contribute to their success. There is a need to shift towards responsible consumerism equal to the efficiency gains made by corporations – doing more with less.

2.3.2.10 Industrial eco-system or metabolism

Eco-industrial development is a new paradigm for achieving excellence in business and environmental performance. It opens up innovative new avenues for managing business and conducting economic development by creating linkages among local ‘resources’, including businesses, non-profit groups, governments, unions, educational institutions, and communities. They can creatively foster dynamic and responsible growth. Antiquated business strategies based on isolated enterprises are no longer responsive enough to market, environmental and community requirements.

Sustainable eco-industrial development has a systematic view of development, business and environment attempting to stretch the boundaries of current practice - on one level. It is as directly practical as making the right connections between the wastes and resources needed for production and at the other level, it is a whole new way of thinking about doing business and interacting with communities. At a most basic level, it is each organization seeking higher performance within itself. However, most eco-industrial activity is moving to a new level by increasing the inter-connections between the companies.

Strategic partnership, networked manufacturing and performed supplier arrangements are all the examples of ways used by the businesses to ensure growth, contain costs and to reach out for new opportunities.

For most businesses, the two essentials for success are the responsive markets and access to cost-effective, quality resources for production or delivering services. In absence of these two factors, every other incentive virtually becomes a minor consideration.

Transportation issues are important at two levels – the ability to get goods to market in an expeditious way is essential to success in this day of just-in-time inventories. The use of least impact transportation, with due consideration of speed and cost, supports business success and addresses the concerned in community.

Eco-industrial development works because it consciously mixes a range of targeted strategies shaped to the contours of the local community. Most importantly, it works because the communities want nothing less than the best possible in or near their neighborhood. For companies, it provides a path towards significant higher operating results and positive market presence. For our environment, it provides greater hope that the waste will be transformed into valued product and that the stewardship will be a joint pledge of both businesses and communities.

2.3.2.11 Voluntary agreements

Voluntary environmental agreements among the industries, government, public representatives, NGOs and other concerned towards attaining certain future demands of the environment are reported to be successful. Such agreements may be used as a tool wherever the Government likes to make the standards stringent in future (phase-wise-stringent). These may be used when conditions are temporary and require timely replacement. Also, these may be used as supplementary/ complimentary in implementation of the regulation. The agreements may include:

- Target objectives (emission limit values/standards)
- Performance objectives (operating procedures)
- R&D activities – Government and industry may have agreement to establish better control technologies.
- Monitoring & reporting of the agreement conditions by other agents (NGOs, public participants, civil authority *etc.*)

In India, the MoEF has organized such programme, popularly known as the corporate responsibility for environment protection (CREP) considering identified 17 categories of high pollution potential industrial sectors. Publication in this regard is available with Central Pollution Control Board (CPCB).

2.3.3 Tools for communication

2.3.3.1 State of environment

The Government of India has brought out the state of environment report for entire country and similar reports are available for many of the states. These reports are published at regular intervals to record trends and to identify the required interventions at various levels. These reports consider the internationally accepted DPSIR framework for the presentation of the information. DPSIR refers to

- D – Driving forces – causes of concern *i.e.* industries, transportation *etc.*
- P – Pressures – pollutants emanating from driving forces *i.e.*, emission
- S – State – quality of environment *i.e.*, air, water & soil quality
- I – Impact – Impact on health, ecosystem, materials, biodiversity, economic damage *etc.*
- R – Responses – action for cleaner production, policies (including standards/guidelines), targets *etc.*

Environment reports including the above elements give a comprehensive picture of specific target area in order to take appropriate measures for improvement. Such reports capture the concerns which could be considered in EIAs.

2.3.3.2 Corporate environmental reporting

Corporate Environmental Reports (CER) are just a form of environmental reporting defined as publicly available, stand-alone reports, issued voluntarily by the industries on their environmental activities. CER is just a means of environmental improvement and greater accountability, not an end in itself.

Three categories of environmental disclosure are:

- Involuntary Disclosure: Without its permission and against its will (env. Campaign, press *etc.*)
- Mandatory Disclosure: As required by law
- Voluntary Disclosure: The disclosure of information on a voluntary basis

2.4 Objectives of EIA

Objectives of EIA include the following:

- To ensure that the environmental considerations are explicitly addressed and incorporated into the development and decision-making process;
- To anticipate and avoid, minimize or offset the adverse significant biophysical, social and other relevant effects of development proposals;
- To protect the productivity and capacity of natural systems and the ecological processes which maintain their functions; and
- To promote development that is sustainable and optimizes resource use as well as management opportunities.

2.5 Types of EIA

Environmental assessments could be classified into four types *i.e.*, strategic environmental assessment, regional EIA, sectoral EIA and project level EIA. These are precisely discussed below:

Strategic environmental assessment

Strategic Environmental Assessment (SEA) refers to systematic analysis of the environmental effects of development policies, plans, programmes and other proposed strategic actions. SEA represents a proactive approach to integrating environmental considerations into the higher levels of decision-making – beyond the project level, when major alternatives are still open.

Regional EIA

EIA in the context of regional planning integrates environmental concerns into development planning for a geographic region, normally at the sub-country level. Such an approach is referred to as the economic-cum-environmental (EcE) development planning. This approach facilitates adequate integration of economic development with management of renewable natural resources within the carrying capacity limitation to achieve sustainable development. It fulfils the need for macro-level environmental integration, which the project-oriented EIA is unable to address effectively. Regional EIA addresses the environmental impacts of regional development plans and thus, the context for project-level EIA of the subsequent projects, within the region. In addition, if environmental effects are considered at regional level, then the cumulative environmental effects of all the projects within the region can be accounted.

Sectoral EIA

Instead of project-level-EIA, an EIA should take place in the context of regional and sectoral level planning. Once sectoral level development plans have the integrated sectoral environmental concerns addressed, the scope of project-level EIA will be quite minimal. Sectoral EIA will help in addressing specific environmental problems that may be encountered in planning and implementing sectoral development projects.

Project level EIA

Project level EIA refers to the developmental activity in isolation and the impacts that it exerts on the receiving environment. Thus, it may not effectively integrate the cumulative effects of the development in a region.

From the above discussion, it is clear that the EIA shall be integrated at all levels *i.e.*, strategic, regional, sectoral and project level. Whereas, the strategic EIA is a structural change in the way the things are evaluated for decision-making, the regional EIA refers to substantial information processing and drawing complex inferences. The project-level EIA is relatively simple and reaches to meaningful conclusions. Therefore in India, project-level EIA studies take place on a large-scale and are being considered. However, in the re-engineered Notification, provisions are incorporated for giving a single clearance for the entire industrial estate for *e.g.*, Leather parks, pharma cities, *etc.*, which is a step towards the regional approach.

As we progress and the resource planning concepts emerge in our decision-making process, the integration of overall regional issues will become part of the impact assessment studies.

2.6 Basic EIA Principles

By integrating the environmental impacts of the development activities and their mitigation in early stages of project planning, the benefits of EIA could be realized in all the stages of a project, from exploration, planning, through construction, operations, decommissioning, and beyond site closure.

A properly-conducted-EIA also lessens conflicts by promoting community participation, informing decision-makers, and also helps in laying the base for environmentally sound projects. An EIA should meet at least three core values:

- Integrity: The EIA process should be fair, objective, unbiased and balanced
- Utility: The EIA process should provide balanced, credible information for decision-making
- Sustainability: The EIA process should result in environmental safeguards

Ideally an EIA process should be:

- Purposive- should inform decision-makers and result in appropriate levels of environmental protection and community well-being.
- Rigorous- should apply ‘best practicable’ science, employing methodologies and techniques appropriate to address the problems being investigated.
- Practical- should result in providing information and acceptable and implementable solutions for problems faced by the proponents.
- Relevant- should provide sufficient, reliable and usable information for development planning and decision-making.
- Cost-effective- should impose minimum cost burdens in terms of time and finance on proponents and participants consistent with meeting accepted requirements and objectives of EIA.
- Efficient- should achieve the objectives of EIA within the limits of available information, time, resources and methodology.
- Focused- should concentrate on significant environmental effects and key issues; *i.e.*, the matters that need to be considered while making decisions.
- Adaptive- should be adjusted to the realities, issues and circumstances of the proposals under review without compromising the integrity of the process, and be iterative, incorporating lessons learnt throughout the project life cycle.
- Participative- should provide appropriate opportunities to inform and involve the interested and affected public, and their inputs and concerns should be addressed explicitly in the documentation and decision-making.
- Inter-disciplinary- should ensure that appropriate techniques and experts in relevant bio-physical and socio-economic disciplines are employed, including the use of traditional knowledge as relevant.
- Credible- should be carried out with professionalism, rigor, fairness, objectivity, impartiality and balance, and be subject to independent checks and verification.

- Integrated- should address the inter-relationships of social, economic and biophysical aspects.
- Transparent- should have clear, easily understood requirements for EIA content; ensure public access to information; identify the factors that are to be taken into account in decision-making; and acknowledge limitations and difficulties.
- Systematic- should result in full consideration of all relevant information on the affected environment, of proposed alternatives and their impacts, and of the measures necessary to monitor and investigate residual effects.

2.7 Project Cycle

The generic project cycle including that of Thermal Power Plant has six main stages:

1. Project concept
2. Pre-feasibility
3. Feasibility
4. Design and engineering
5. Implementation
6. Monitoring and evaluation

It is important to consider the environmental factors on an equal basis with technical and economic factors throughout the project planning, assessment and implementation phases. Environmental consideration should be introduced at the earliest in the project cycle and must be an integral part of the project pre-feasibility and feasibility stage. If the environmental considerations are given due respect in site selection process by the project proponent, the subsequent stages of the environmental clearance process would get simplified and would also facilitate easy compliance to the mitigation measures throughout the project life cycle.

A project's feasibility study should include a detailed assessment of significant impacts and the EIA include a detailed prediction and quantification of impacts and delineation of Environmental Management Plan (EMP). Findings of the EIA study should preferably be incorporated in the project design stage so that the project is studied, the site alternatives are required and necessary changes, if required, are incorporated in the project design stage. This practice will also help the management in assessing the negative impacts and in designing cost-effective remedial measures. In general, EIA enhances the project quality and improves the project planning process.

2.8 Environmental Impacts

Environmental impacts resulting from proposed actions can be grouped into following categories:

- Beneficial or detrimental
- Naturally reversible or irreversible
- Repairable via management practices or irreparable
- Short-term or long-term
- Temporary or continuous
- Occurring during construction phase or operational phase
- Local, regional, national or global

- Accidental or planned (recognized before hand)
- Direct (primary) or Indirect (secondary)
- Cumulative or single

The category of impact as stated above and its significance will facilitate the Expert Appraisal Committee (EAC)/State Level EAC (SEAC) to take a look at the ToR for EIA studies, as well as, in decision making process about the developmental activity.

Figure 2-2: Types of Impacts

The nature of impacts could fall within three broad classifications *i.e.*, direct, indirect and cumulative, based on the characteristics of impacts. The assessment of direct, indirect and cumulative impacts should not be considered in isolation nor can be considered as separate stages in the EIA. Ideally, the assessment of such impacts should form an integral part of all stages of the EIA. The TGM does not recommend a single method to assess the types of impacts, but suggests a practical framework/approach that can be adapted and combined to suit a particular project and the nature of impacts.

2.8.1 Direct impacts

Direct impacts occur through direct interaction of an activity with an environmental, social, or economic component. For example, a discharge of Thermal Power Plant or effluent from the Effluent Treatment Plant (ETP) into a river may lead to a decline in water quality in terms of high biochemical oxygen demand (BOD) or dissolved oxygen (DO) or rise of water toxins. Another example of direct impact of a TPP is the emissions of SO_x in flue gases shall enhance the ambient air pollution concentration of SO₂, *etc.*

2.8.2 Indirect impacts

Indirect impacts on the environment are those which are not a direct result of the project, often produced away from or as a result of a complex impact pathway. The indirect impacts are also known as secondary or even tertiary level impacts. For example, ambient air SO₂ rise due to stack emissions may deposit on land as SO₄ and cause acidic soils. Another example of indirect impact is the decline in water quality due to rise in

temperature of water bodies receiving cooling water discharge from the nearby industry. This, in turn, may lead to a secondary indirect impact on aquatic flora in that water body and may further cause reduction in fish population. Reduction in fishing harvests, affecting the incomes of fishermen is a third level impact. Such impacts are characterized as socio-economic (third level) impacts. The indirect impacts may also include growth-inducing impacts and other effects related to induced changes to the pattern of land use or additional road network, population density or growth rate (e.g. around a power project). In the process, air, water and other natural systems including the ecosystem may also be affected.

2.8.3 Cumulative impacts

Cumulative impact consists of an impact that is created as a result of the combination of the project evaluated in the EIA together with other projects in the same vicinity causing related impacts. These impacts occur when the incremental impact of the project is combined with the cumulative effects of other past, present and reasonably foreseeable future projects. Figure 2-3 depicts the same. Respective EAC may exercise their discretion on a case-by-case basis for considering the cumulative impacts.

Figure 2-3: Cumulative Impact

2.8.4 Induced impacts

The cumulative impacts can be due to induced actions of projects and activities that may occur if the action under assessment is implemented such as growth-inducing impacts and other effects related to induced changes to the pattern of future land use or additional road network, population density or growth rate (e.g. excess growth may be induced in the zone of influence around the thermal power plant, and in the process causing additional effects on air, water and other natural ecosystems). Induced actions may not be officially announced or be a part of any official announcement/plan. Increase in workforce and nearby communities contributes to this effect.

They usually have no direct relationship with the action under assessment, and represent the growth-inducing potential of an action. New roads leading from those constructed for a project, increased recreational activities (e.g., hunting, fishing), and construction of new service facilities are examples of induced actions.

However, the cumulative impacts due to induced development or third level or even secondary indirect impacts are difficult to be quantified. Because of higher levels of uncertainties, these impacts cannot normally be assessed over a long time horizon. An EIA practitioner can only guess as to what such induced impacts may be and the possible extent of their implications on the environmental factors. Respective EAC may exercise their discretion on a case-by-case basis for considering the induced impacts.

2.9 Significance of Impacts

This TGM establishes the significance of impacts first and proceeds to delineate the associated mitigations measures. So the significance here reflects the “worst-case-scenario” before mitigation is applied, and therefore provides an understanding of what may happen if mitigation fails or if it is not as effective as predicted. For establishing significance of different impacts, understanding the responses and interaction of the environmental system is essential. Hence, the impact interactions and pathways are to be understood and established first. Such an understanding will help in the assessment process to quantify the impact as accurately as possible. Complex interactions, particularly in case of certain indirect or cumulative impacts, may give rise to non-linear responses which are often difficult to understand and therefore their significance is difficult to assess their significance. It is hence understood that indirect or cumulative impacts are more complex than the direct impacts. Currently the impact assessments are limited to direct impacts. In case mitigation measures are delineated before determining significance of the effect, the significance represents the residual effects.

However, the ultimate objective of an EIA is to achieve sustainable development. The development process shall invariably cause some residual impacts even after implementing an EMP effectively. Environmentalists today are faced with a vital, not-easy-to-answer question—“What is the tolerable level of environmental impact within the sustainable development framework?” As such, it has been recognized that every ecosystem has a threshold for absorbing deterioration and a certain capacity for self-regeneration. These thresholds based on concept of carrying capacity are as follows:

- Waste emissions from a project should be within the assimilative capacity of the local environment to absorb without unacceptable degradation of its future waste absorptive capacity or other important services.
- Harvest rates of renewable resource inputs should be within the regenerative capacity of the natural system that generates them; depletion rates of non-renewable inputs should be equal to the rate at which renewable substitutes are developed by human invention and investment.

The aim of this model is to curb over-consumption and unacceptable environmental degradation. But because of limitation in available scientific basis, this definition provides only general guidelines for determining the sustainable use of inputs and outputs. To establish the level of significance for each identified impact, a three-stage analysis may be referred:

- First, an impact is qualified as being either negative or positive.
- Second, the nature of impacts such as direct, indirect, or cumulative is determined using the impact network
- Third, a scale is used to determine the severity of the effect; for example, an impact is of low, medium, or high significance.

It is not sufficient to simply state the significance of the effect. This determination must be justified, coherent and documented, notably by a determination methodology, which must be described in the methodology section of the report. There are many recognized methodologies to determine the significance of effects.

2.9.1 Criteria/methodology to determine the significance of the identified impacts

The criteria can be determined by answering some questions regarding the factors affecting the significance. This will help the EIA stakeholders, the practitioner in particular, to determine the significance of the identified impacts eventually. Typical examples of such factors (one approach reported by Duval and Vonk 1994) include the following:

- Exceeding of threshold limit: Significance may increase if the threshold is exceeded. For *e.g.*, Emissions of particulate matter exceed the permissible threshold.
- Effectiveness of mitigation: Significance may increase as the effectiveness of mitigation measures decreases. *e.g.*, control technologies, which may not assure consistent compliance to the requirements.
- Size of study area: Significance may increase as the zone of effects increases.
- Incremental Contribution of Effects from Action under Review: Significance may increase as the relative contribution of an action increases.
- Relative contribution of effects of other actions: Significance may decrease as the significance of nearby larger actions increase.
- Relative rarity of species: Significance may increase as species becomes increasingly rare or threatened.
- Significance of Local Effects: Significance may increase as the significance of local effects is high.
- Magnitude of change relative to natural background variability: Significance may decrease if effects are within natural assimilative capacity or variability.
- Creation of induced actions: Significance may increase activities also highly significant.
- Degree of existing disturbance: Significance may increase if the surrounding environment is pristine.

For determining the significance of impacts, it is important to remember that secondary and higher order effects can also occur as a result of a primary interaction between the project activity and local environment. Wherever a primary effect is identified, the practitioner should always think if secondary or tertiary effects on other aspects of the environment could also arise.

The EIA should also consider the effects that could arise from the project due to induced developments, which take place as a consequence of the project. Ex. Population density and associated infrastructure and jobs for people attracted to the area by the project. It also requires consideration of cumulative effects that could arise from a combination of the effects due to other projects with those of other existing or planned developments in the surrounding area. So the necessity to formulate a qualitative checklist is suggested to test significance, in general.

3.

ABOUT THERMAL POWER PLANTS INCLUDING PROCESS AND POLLUTION CONTROL TECHNOLOGIES

3.1 Introduction to the Industry

Thermal Power Plants (TPPs) convert the energy content of an energy carrier (fuel) into either electricity or heat. The type of power plant employed depends on the source of energy and type of energy being produced. Possible fuel sources include:

- Fossil fuels such as coal, petroleum products and natural gas
- Residual and waste materials such as domestic and industrial refuse and fuel made from recovered oil
- Fissionable material (the scope of this document do not include fissionable material)

Anthracite coal is the largest source of fuel for electricity generation followed by brown coal, natural gas and petroleum oils. Non-fossil sources of fuel such as landfill gas and biogases are also used. In some cases, these non-fossil fuels are co-fired with coal. Emission factors for coal-bed methane and non-fossil fuels are not included in this Manual. Renewable sources of electricity generation such as wind power and solar power are making an increasing contribution, but again not included here.

The major components of TPP include the power system (*i.e.*, power source, turbine and generator) and associated facilities, which may include the cooling system, stack gas cleaning equipment, fuel storage handling areas, fuel delivery systems, solid waste storage areas, worker colonies, electrical substations and transmission lines, *etc.* The type of facility and size of thermoelectric projects, as well as technological configuration of generation system and also other associated facilities besides, environmental and social concerns of plant location, will determine the nature and intensity of environmental impacts of proposed TPP facility. Figure 3-1 is a generalized flow schematic of different major components of a boiler-based TPP operations. The major pollution sources are also depicted for a typical TPP plant operational configuration.

The frame of reference of this document is limited to the fossil-fueled based power plants, in particular types using coal and petroleum products (including diesel and petro-coke). The hydropower sector will be dealt separately.

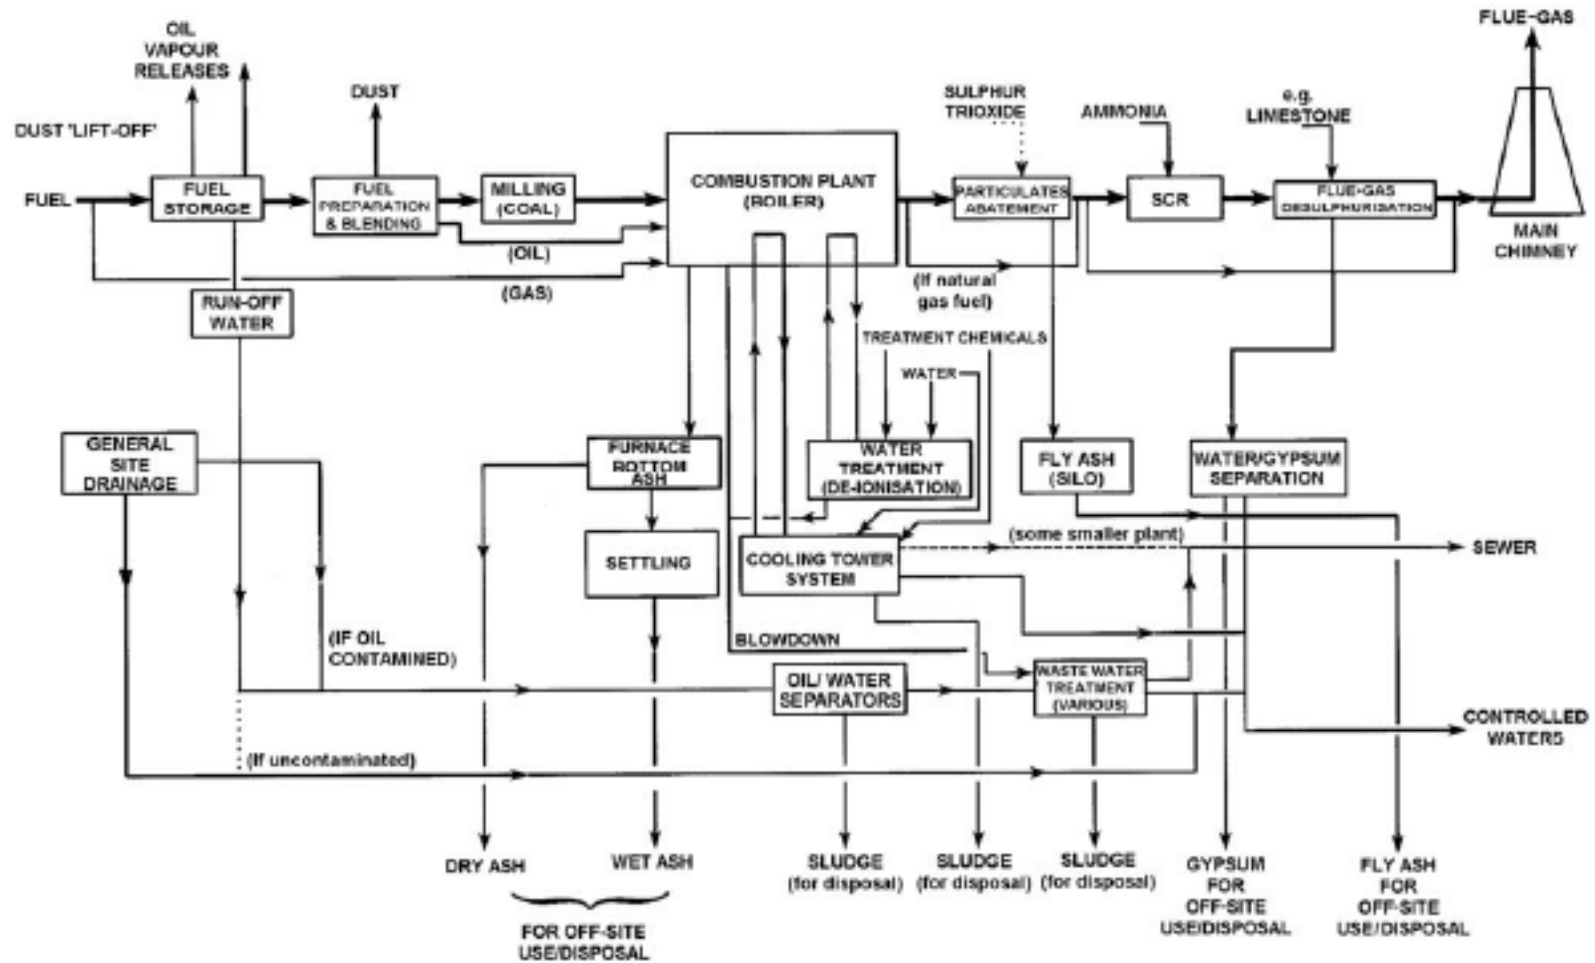

Figure 3-1: Generalized Flow Diagram of TPP and Associated Operations

3.1.1 National power scenario

Power development in India was first started in 1897 in Darjeeling, followed by commissioning of a hydropower station at Sivasamudram in Karnataka during 1902 (India 2007). While India has made enormous strides in electricity growth, power availability in India falls far short of global benchmarks. Lack of power availability is widely seen as a bottleneck to industrial development as the country aims to rapidly increase its pace of economic growth (World Bank, 1999). Long-term projections indicate that an installed capacity of nearly 800 Gigawatt (GW) by 2030 is required to maintain an average annual GDP growth of 8% (Planning Commission, 2006).

Key features of the Indian electricity sector:

- Power sector is one of the core industrial sectors, which plays a very significant role in overall economic growth of the country. The power sector needs to grow at the rate of at least 12% to maintain the present GDP growth of about 8%.
- As per the Ministry of Power report, during the year 2004 – 2005, the per capita consumption of electricity in India is 606 kWh/year. The per capita consumption of electricity is expected to grow to 1000 kWh/year by the year 2012.
- To meet the per capita consumption of 1000 kWh / year by the year 2012 the capacity augmentation requirement is about 1, 00,000 Megawatt (MW).
- The present installed capacity of the power generating units is 1, 24,311 MW.
- Presently there is a significant gap between the demand and supply of power. The energy deficit is about 8.3% and the power shortage during the peak demand is about 12.5%.
- The details of power situation from April 2005 to February 2006 are as below.

The installed power generation capacity in the country has increased from 1,400 MW in 1947 to 1,24,287.17 MW as on 31 March 2006 comprising 82,410.54 MW thermal, 32,325 MW hydro, 6190.86 Renewable Energy Sources (RES) and 3360 MW nuclear (India 2007). As the demand for electricity is expected to rise exponentially over the next decade out of three major energy sources, thermal power generation shall be dominating for medium term needs.

Demand for energy growth: Though, India has made enormous strides in electricity growth, it still has much lower global benchmark in electricity usage. In 2002, per capita consumption was 420 kWh, in contrast to the non-OECD (Organization for Economic Cooperation and Development) average of 1100 kWh and the OECD average of 8000 kWh (International Energy Agency 2004). The country has been routinely experiencing energy shortages of 6-12% whereas peak demand shortages varied between 11-20% over the last decade. Lack of power availability is widely seen as a bottleneck to industrial development, as the country aims to rapidly increase its pace of economic growth (World Bank, 1999). Furthermore, energy security has rightly emerged as a priority area for India's development prospects. Such a backdrop indicates the situation and warrants a long-term power sector development strategy that addresses various issues, in a balanced manner. India has an installed capacity of 112 GW, transmission & distribution infrastructure of over 5.7 million circuit kilometres. The general feature of Indian electricity sector is as under:

Table 3-1 presents the international comparative scenario of the Indian energy sector with a number of key indicators and reflects India has extremely low levels of energy use on a

per capita basis, in comparison to the global average. The total primary energy supply (TPES) in the country was 0.51 Tonne Oil Equivalent (TOE) in 2002 – this is almost one-tenth of the OECD average, less than a third of the global average.

Table 3-1: Indicators of Energy and Electricity Use in Various Countries

	TPES/Capita (TOE)		TPES*/Capita (TOE)		Electricity/Capita (kWh)		Electricity/GDP (MWh/million 2000 international PPP\$)		GDP/Capita (2000 international PPP\$)	
	1990	2002	1990	2002	1990	2002	1990	2002	1990	2002
India	0.43	0.51	0.22	0.31	275	421	161	165	1702	2555
China	0.78	0.96	0.60	0.79	511	1184	320	270	1597	4379

Japan	3.61	4.06	3.61	4.06	6609	8223	282	316	23442	26021
Global	1.64	1.65	1.46	1.47	848	888	327	310	6312	7649

(TPES: refers to total primary energy supply and TPES* refers to TPES excluding renewable and combustible sources.)

Source: (World Bank, 2002; IEA, 2004a, 2004b)

The priority issues of immediate concern include (i) meeting the growing demand for electricity at affordable cost; (ii) ensuring the security of primary energy supply through an appropriate mix of sources; and (iii) minimising the environmental impacts and also (iv) complying with the climate change needs.

Coal and lignite accounted for about 57% of installed capacity (68 GW out of 118 GW) and 71% of generated electricity (424 TWh out of 594 TWh) in the country in 2004-05 where as, currently, the power sector consumes about 80% of the coal produced in the country. To meet the projected power requirement by 2012, an additional capacity of 1,00,000 MW is required during the 10th & 11th Five-Year Plans. A capacity of nearly 41,110 MW is targeted to be set up in the Tenth Plan and the remaining in the Eleventh Plan with a Thermal generation of 25416.24 MW.

Keeping in view, the huge power generation capacity requirement, Ministry of Power/Central Electricity Authority has proposed 100,000 MW environment friendly thermal initiative. This initiative intends to prepare shelf of projects, which could be taken up during the course of 11th and 12th Plan. However, coal is the only well-proven significant domestic resource to increase energy security in the country, the technology choices will be impacted by the quality of the domestic coal reserves, but still preference should be for high-efficiency.

3.1.2 Fuel quality & availability

The projected rapid growth in electricity generation in the country over the next couple of decades is expected to be met by using coal as the primary fuel for electricity generation. Other resources are uneconomic (as in case of naphtha or LNG), have insecure supplies

(diesel and imported natural gas), or simply too complex and expensive to build (nuclear and hydroelectricity) to make a dominant contribution to the near-to-mid term growth.

Liquid fuels such as heavy oils have limited use in the power sector for economic and environmental reasons. Distillates such as naphtha, high sulphur diesel (HSD), and other condensates are either expensive or too polluting for large-scale use. Although, domestic distillates are now allowed for use in the power sector, they are used in only niche applications. Given the limited domestic oil reserves (790 million tons in 2004-05114 – 0.5% of world reserves) and production (34 million tons in 2004-05114), as far as natural gas in the power sector is concerned, its long-term availability and cost are uncertain. Similar to oil, domestic reserves are very limited (1100 billion cubic meters in 2004-05114 – 0.6% of world’s reserves). Although, recent gas findings have increased this hope, the high cost of natural gas is still another crucial factor that is limiting the growth of the gas based power generation. However, the use of natural gas in the power sector is expanding fast and it is projected to increase faster by Planning Commission (2006) and others to increase in short-to-medium term.

3.1.2.1 Coal quality & availability constraints

Indian coal has general characteristics of the Southern Hemisphere Gondwana coal which is of low calorific value and high ash and typically has the following qualities (Sachdev, 1998; IEA, 2002a):

- Ash content ranging from 40-50%, with low iron content and negligible toxic trace elements
- Moisture content between 4 – 20%
- Sulphur content between 0.2 – 0.7%
- Gross calorific value between 2500 – 5000 kcal/kg, with non-coking steam coal being in the range of 2450 – 3000 kcal/kg (Visuvasam *et al.*, 2005).
- Volatile matter content between 18 – 25%.

It is quite obvious that the quality of Indian coal is poor and has gotten worse over the past decades as ash content increased from 25% (calorific content 4700 kcal/kg) to 45% (3000 kcal/kg). On an average, the Indian power plants consume about 0.7 kg of coal to generate a kWh (CEA, 2004b), whereas the U.S. power plants consume about 0.45 kg of coal per kWh (EIA, 2001).

Table 3-2: Coal Supply Position for Utility TPPs

STATUS	YEAR			
	2003-04	2004-05	2005-06	2006-07

Consumption (Includes Imported Coal)	263.608	277.735	281.336	302.539
Closing Stock (Includes Imported Coal)	9.924	10.499	18.174	14.122

3.1.2.2 Coal beneficiation

In 1997, the MoEF mandated the use of beneficiated coals with ash content of 34% (or lower) in power plants located beyond 1000 km from their coal source, and plants located in critically polluted areas, urban areas, and ecologically sensitive areas (CPCB, 2000b). There were about 18 coking coal washeries in India with a total annual capacity of 30 Metric Tonne (MT) (Singh, 2005). However, only 5 MT of washed coal was being produced and the quality of washed coking coal has reportedly been inconsistent and deteriorating over time primarily because of supply of low-grade raw coal (Ministry of Coal, 2006).

In this situation, private sector took increasing interest in building coal washeries. In the last few years, the coal washery capacity in India has risen to 90 MT. More than 40 plants (about 24 GW of capacity) reportedly need better quality coals and the estimated annual cleaner coal consumption was expected to be about 87 MT (CPCB, 2000b).

The most commonly used coal washing technology in India (primarily for coking coals) is the jig washer, which can be engaged for both Baum and Batac types. Some washeries also engage Dense Medium Separation (DMS) systems for coal beneficiation.

Besides technology limitations, the other constraints for the development of washery capacity are the institutional structures of the coal industry. Secondly, the quality of coal supplied to the TPPs is not guaranteed (sizing, ash content, calorific value, *etc.*), and there is no penalty for non-compliance. Hence, the power plants had to use the blended coals – using better quality of foreign or a small quantity of well-cleaned domestic coal (CPCB, 2000b).

In order to bridge the gap in the supply of coal from the indigenous sources, the Ministry of Power advised the utilities to import 20.00 Million Tonnes of coal during the year 2006-07.

3.1.3 Oil and natural gas

India's domestic oil and natural gas reserves are very minimal (about 0.5% of world reserves) and over 75% of India's petroleum consumption was met through imports in 2004- 05; 126 petroleum and related products account for about a quarter of India's TPCES (Total Primary Commercial Energy Supply), Planning Commission, 2006. Furthermore, the existing domestic oil and natural gas reserves are likely to be consumed sooner, since the demand will inevitably rise and domestic production will be ramped up, to meet the demand. Clearly, today's oil situation in India is not conducive to being energy secure.

3.1.3.1 Gas requirement and supply position

The production and supply of gas had not been keeping in pace with the growing demand of gas in the country, including that of a power sector. Even the commitments of gas allocations made earlier to power stations were not fulfilled. The supply of gas to power plants up to 2006-07 is given in Table 3-3.

Table 3-3: Supply of Gas to Power Plants

Years	Gas Required (MMSCMD)	Gas Allocation (MMSCMD)	Gas Supplied (MMSCMD)	Shortfall (MMSCMD)
(1)	(2)	(3)	(4)	(5) = (2) - (4)
2000-01	44.54	36.67@	24.40@	20.14
2001-02	46.31	38.76@	24.33@	21.96
2002-03	48.26	39.47@	25.12@	23.14
2003-04	49.25	39.47@	25.62@	23.63
2004-05	49.73	40.95@	30.70@	19.03
2005-06	52.66	Not Available	35.37	17.29
2006-07 (As on 28 th Feb.07)	54.15	Not Available	35.71	18.44

Note:

MMSCMD — Million Metric Standard Cubic Metre per Day

*Normative gas requirement at 90% Plant Load Factor with GCV of 9000 kCal/SCM (except for Ramgarh CCGT for which GCV of 4150 kCal/SCM) and Station Heat Rate of 2000 kCal/kWhr for combined cycle and 2900 kCal/kWhr for open cycle

@ Based on the data made available by MoP&NG

3.1.4 Thermal power generation-capacity addition

India has an installed capacity of 112 GW and a transmission & distribution infrastructure of over 5.7 million circuit kilometres. India ranked sixth in world electricity generation and third in Asia-Pacific, next only to China and Japan in 2002. India's share in world electricity generation has steadily increased from 2.4% in 1994 to 3.6% in 2002. Power generation capacity of Indian electricity sector from 2002-07 is as under:

Table 3-4: Power Generation Capacity

Year	Target (MW)	Achievement (MW)	Achievement (%)
2002-03	2058.00*	2223.10	108.00
2003-04	1437.34	1361.60	94.73
2004-05	2661.52	2933.92	110.23

Year	Target (MW)	Achievement (MW)	Achievement (%)
2005-06	3458.52	1588.80	45.93
2006-07	13122.92	4006.80	30.53
Total	22738.3	12114.22	53.27

Excluding Dabhol CCGT Phase II (1444 MW)

3.1.5 Power generation technology

Raw material, technology and equipment for generating electricity was imported from Britain during the pre-independent era. The coal-fired boilers were of stoker water-tube kind, where coal was burned on a grate, and the hot flue gas was directed towards water-tubes, in which water was converted to high pressure and high temperature steam (Singer et al., 1958; Miller, 2005). Most of the units installed in 1940s were of sizes ranging from 1 MW to 15 MW, and they were designed to work using coal with calorific value greater than 6000 kcal/kg (CBIP, 1997).

In the post-independence era, key priority of the country was to become self-sufficient in food production, and hence the government planned to develop irrigation and power sectors jointly. There were also concerns about coal availability since explored coal resources in India were limited (60 billion tons (BT)) and ‘workable’ coal resource was estimated to be only 20 BT. In addition, the quality of Indian coal was very poor and conversion efficiency was very low – nearly 0.7 kg of coal was consumed to produce a unit of power. Hence, the initial emphasis was on producing power through large ‘multipurpose’ hydroelectric projects that would provide both water and electricity for canal-based irrigation. However, the generation from these projects was not as high as expected (annual rate of generation growth was 12% in the same period because, their construction took much longer than expected).

3.2 Scientific Aspects of Industrial Process

3.2.1 Industrial processes in the context of environmental pollution

Different types of fossil fuel electricity generation facilities broadly include:

- Steam cycle facilities (most commonly used for large utilities);
- Gas turbines (commonly used for moderate sized peaking facilities);
- Cogeneration and combined cycle facility (the combination of gas turbines or internal combustion engines with heat recovery systems); and
- Internal combustion engines (commonly used for small remote sites or stand-by (emergency) generation).

3.2.1.1 Steam cycle facility

Most of the electricity generated in India is produced by steam cycle facility. Figure 3-2 is a basic flow diagram of a steam cycle facility. In the Indian context, conventional steam-producing TPPs generate electricity through a series of energy conversion stages: fuel is burned in boilers to convert water to high-pressure steam, which is then used to drive a steam turbine to generate electricity. Heat for the system is usually provided by the combustion of coal, natural gas, oil, or biomass. High-temperature, high-pressure

steam is generated in the boiler and then enters the steam turbine. At the other end of the steam turbine is the condenser, which is maintained at a low temperature and pressure. Steam rushing from the high-pressure boiler to the low-pressure condenser drives the turbine blades, which powers the electric generator. Low-pressure steam exiting the turbine enters the condenser shell and is condensed on the condenser tubes, which are maintained at a low temperature by the flow of cooling water. As the steam is cooled to condensate, the condensate is transported by the boiler feed water system back to the boiler, where it is used again. A constant flow of low-temperature cooling water in the condenser tubes is required to keep the condenser shell (steam side) at proper pressure and to ensure efficient electricity generation. The boiler water is commonly treated to reduce corrosion and scaling in the boiler tubes. Cooling water used to condense steam is often treated to reduce algal growth. Wet cooling towers, commonly used to dissipate heat from the cooling water, may also be a minor source of aerosol emissions.

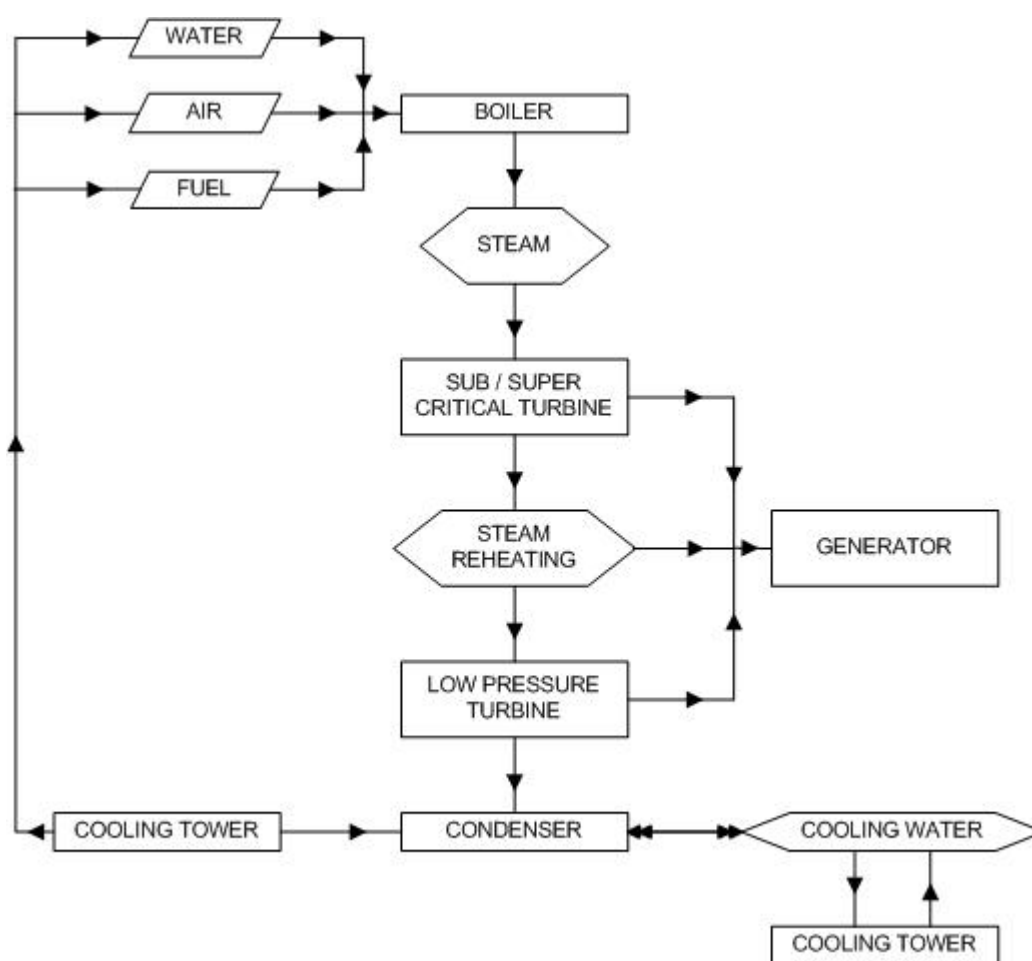

Figure 3-2: Schematic Representation of a Steam Cycle Facility

The properties and composition of Indian coals used for electricity generation vary widely. It is difficult to characterise single set of emission factors that apply to the range of coals used. Steam turbines typically have a thermal efficiency of about 35%, which means 35% of the heat of combustion is transformed into electricity. The remaining 65% of the heat either goes up the stack (typically 10%) or is discharged with the condenser cooling water (typically 55%).

Particulate material (e.g., fly ash or particulate matter) in gas streams from the combustion process are captured by electrostatic precipitators or fabric filters (FF – also called baghouses). Ash is also extracted from the bottom of the boiler (bottom ash). Ash is transported to ash ponds as a slurry, dense phase (paste), or dry. Fly ash from some power stations is used for blending with cement. Ash is composed of modified coal mineral matter, i.e., primary compounds of silicon, aluminum, iron, calcium, manganese, potassium, sodium and titanium, which form a matrix for traces of compounds of other metals. Ash composition depends on the coal properties, combustion technology and combustion conditions. Usually, very small amount of ash is released to air after ash control technology. The major emissions to air include carbon dioxide (CO₂), water vapour, carbon monoxide (CO), oxides of nitrogen (NO_x), and sulphur dioxide (SO₂). There are much lower emissions of metals and organic compounds. CO₂ and water vapour are not considered as pollutants and are not included in the purview of EIA.

Common boiler types used can be divided into wall firing (i.e., burners of one or two walls), or tangential firing (i.e., corner burners that create a circular shaped flame). Coal and ash storage, their handling facilities, and bulk hydrocarbon storage associated with power station operations, can lead to fugitive dust (i.e., coal or ash) and hydrocarbon emissions to air respectively. The pollution potentials concerning air, water, land and soil environments are summarized in Table 3-5.

Table 3-5: Emissions from Steam Cycle TPPs

Source	Input	Output
Air Pollution Emissions		
Steam cycle/natural gas	Natural gas, auxiliary fuel (fuel oil, distillate, LPG), dematerialized water, cooling water, lubricants, degreasers, water treatment chemicals.	NO _x , CO, SO _x (very low), PM10, Organic Compounds (OCs), and trace metals & compounds
Steam cycle/oil	Fuel oil, auxiliary fuel (natural gas, distillate, LPG), dematerialized water, lubricants, degreasers	NO _x , SO _x , CO, particulates (including PM10), trace metals & compounds, OCs.
Steam cycle/Pulverized coal	Coal, dematerialized water, auxiliary fuel (fuel oil, natural gas, briquettes, lubricants, degreaser, water treatment chemicals)	NO _x , CO, SO _x , particulates (including PM10), fugitive dust, trace metals & compounds, OCs.
Water Pollution Emissions		
Steam cycle/pulverized coal, natural gas, oil	Coal, dematerialized water, auxiliary fuel (fuel oil, natural gas, briquettes), lubricants, degreasers, water treatment chemicals/effluent, detergents	Chlorine, acids, alkalis, suspended solids, nitrogen, phosphorus, trace metals & compounds, oil spills, degreasers, detergents
Land Pollution Emissions		
Steam cycle/pulverized coal, natural gas, oil	Coal, dematerialized water, auxiliary fuel (fuel oil, natural gas, briquettes), lubricants, degreasers, water treatment chemicals	ash, oil/chemical spills, metals & compounds, wastes

Fluidized-bed combustion: Indian power sector ventured into the circulating fluidized-bed (CFBC) boilers at the utility scale with external collaboration, but did not progress much. The key advantage of using CFBC boilers is their relative insensitivity to coal properties – these boilers can burn high-ash, high-moisture content, and low-calorific value coal (including lignite), and therefore are well suited for Indian poor-quality coals. CFBC boilers (2x125 MW) were successfully commissioned in 2000 in the Surat Lignite Power Plant. Installation of 2x125 MW CFBC units is in progress in Akrimota, Gujarat. However, for recycling of coal washery middling and other low-quality domestic coal, CFBC offers a good opportunity addition.

Gas and oil-fired steam cycle: A major difference between coal-fired facilities and gas or oil-fired facilities, is that gas and oil facilities burn the fuel with minimal on-site processing before combustion. Generally, they do not have control equipment to collect particulate matter, as emissions of particulate matter are low. Emissions to air include CO₂, water vapour, NO_x, CO, minor emissions of metals and metal compounds and organics, and SO₂ for oil firing. Bulk hydrocarbon storage can be a source of emissions of Total Volatile Organic Compounds (TVOCs) and of individual hydrocarbon substances due to evaporative losses from storage tanks.

Natural gas and liquid fuels are usually transported to TPPs via pipelines. Coal and biomass fuels can be transported by rail, barge, or truck. In some cases, coal is mixed with water to form slurry that is pumped to the TPP in a pipeline. Once coal arrives at the plant, it is unloaded to storage or directly to the stoker or hopper. In transporting coal during warmer months and in dry climates, dust is airborne.

3.2.1.2 Gas turbine

Gas turbine systems operate in a manner similar to steam turbine systems except that combustion gases are used to turn the turbine blades instead of steam. In addition to the electric generator, the turbine also drives a rotating compressor to pressurize the air, which is then mixed with either gas or liquid fuel in a combustion chamber. The greater the compression, the higher the temperature and the efficiency that can be achieved in a gas turbine. Higher temperatures; however, typically lead to increase in NO_x emissions. Exhaust gases are emitted to the atmosphere from the turbine. Unlike a steam turbine system, gas turbine systems do not have boilers or a steam supply, condensers, or a waste heat disposal system. Therefore, capital costs are much lower for a gas turbine system than for a steam system.

Figure 3-3 illustrates a simple open cycle gas turbine facility. Gas turbine facilities are generally physically smaller and produce less electricity than steam cycle facilities and can be operated with short start-up periods. They are commonly used to generate electricity at peak load periods. Gas turbines are also used as standby (*i.e.*, emergency) facilities. Occasionally, gas turbine facilities are used for base load operations. Emissions to air from a gas turbine facility include CO₂, water vapour, CO, NO_x, and minor emissions of metals and metal compounds and organics. Emissions to water from gas turbine facilities tend to be minor and relate to maintenance activities. Bulk hydrocarbon storage can be a source of emissions. The pollution potentials concerning air, water, land and soil environments from Gas Turbine Facility are summarized in Table 3-6.

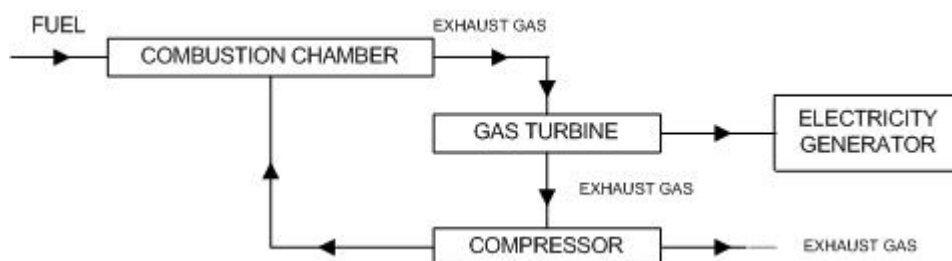

Figure 3-3: Flow Diagram of a Gas Turbine Facility

Table 3-6: Emissions from Gas Turbine

Technology/Fuel	Inputs	Output
Air Pollution Emissions		
Gas turbine/distillate	Distillate, auxiliary fuel (LPG), lubricants, degreasers, dematerialized water (cogeneration cycle)	NO _x , SO _x , CO, particulates (including PM ₁₀), trace metals and compounds, OCs.
Gas turbine/natural gas	Natural gas, auxiliary fuel (distillate, LPG), lubricants, degreasers, dematerialized water (cogeneration/combined cycle)	NO _x , SO _x (very low), CO, OCs, and trace metals & compounds
Water Pollution Emissions		
Gas turbine/natural gas, distillate	Natural gas, auxiliary fuel (distillate, LPG), lubricants, degreasers, detergents, cooling system inhibitors	Oil spills, degreasers, cooling system inhibitors, detergents
Land/Soil Pollution Emissions

3.2.2 Power generation technology options

Since 1970s, coal-based power plants have dominated the power generation sector and are almost exclusively based on sub-critical pulverised coal (PC) technology. This domination of coal in the power sector is likely to continue in the future. About 50 GW of new coal-based capacity is planned for the 11th Plan, and long term scenarios explored by the Planning Commission suggest that coal will continue to dominate the power sector consumption at least for the next three decades (Planning Commission, 2006).

As far as power generation technologies are concerned, there are a number of technological options – both existing and emerging – that can potentially help the coal power sector meet its goal of additional capacity in a manner consistent with its other challenges as highlighted earlier. However, the appropriate technology choices are also constrained by the quality of Indian coal. Furthermore, the extent of available coal reserves will also impact technology choices in the long-term, with high-efficiency being preferred. The focus on rapid capacity additions, limited competition with dominance of

government-owned enterprises, and lack of long-term technology planning have resulted in technology replication rather than innovation for development and deployment of new technologies.

Though, pulverised coal combustion continues to dominate the thermal power generation in India there are number of proven options available based on advanced coal technologies to meet the Indian requirements of making power generation cleaner, more efficient, and more able to utilize the varying characteristics relevant to the Indian coal reserves. Pulverised coal technologies have improved, resulting in increased efficiency and reduced local pollution. New combustion technology using circulating fluidized-beds has been demonstrated that lower quality coals including waste coal and washery middlings or even biomass can be used for power generation. Efforts are also underway to commercialize coal-gasification-based integrated power generation. Use of pure oxygen (oxyfuel combustion) instead of air is also being considered for addressing GHG requirements.

The efficiency of the power plant is also the most sensitive parameter in determining cost of generation. When it comes to old plants there is a large gap between the actual and design efficiencies. The operational status also indicates that there is ample scope for efficiency improvements. Increasing efficiency by 1% point in a power plant can reduce coal use, and also the emissions of air pollutants and CO₂ emissions, by 3% (Deo Sharma, 2004).

The above discussions reflect that the two fundamental processes for extraction of energy from coal are (i) Direct Solid Combustion such as conventional Pulverised Coal (PC) Combustion or the emerging Fluidised Bed Combustion (FBC) and (ii) Indirect combustion through coal gasification followed by coal gas combustion.

Fluidised Bed Combustor is a “three-in-one device” characterised by highly desirable features of multi-fuel capability, pollution (SO₂ and Nox) control, and energy conservation. All the four members of this family, namely Atmospheric Fluidised Bed Combustor (AFBC), Circulating Fluidised Bed Combustor (CFBC), Pressurised Fluidised Bed Combustor (PFBC) and Pressurised Circulating Fluidised Bed Combustor (PCFBC) have the potential for clean power generation. Additionally, PFBC and PCFBC systems operating in a combined cycle mode (Rankine and Brayton) have the potential for overall plant efficiencies of the order of 40-45% compared to 33-37% efficiencies offered by power plants based on Conventional PC firing, AFBC and CFBC operating on a single (Rankine) cycle. Coal gasification, at pressures up to 40 atm and suitable temperatures results in a low-calorific value (4 -7 MJ/Nm³) and gas mixture of CO and H₂, which can be burnt and expanded in a gas turbine for power generation. In an Integrated Gasifier Combined Cycle (IGCC) plant, this is supplemented by steam turbine power generation using steam generated from the gas turbine exhaust gases. Three types of coal gasifiers are in different stages of demonstration and commercialisation in the world: Fixed Bed (Moving Bed) Gasifier (*e.g.* the LURGI Dry Ash System), Fluidised Bed Gasifier (*e.g.* KRW system)

Clean coal based technologies

A number of technologies based on coal combustion/coal gasification/combination of coal combustion and coal gasification aimed at environmental acceptability and high efficiency have been under development for almost three decades. Four of these are proven commercial technologies while the rest are in different stages of development and demonstration as given in the Table 3-7.

Table 3-7: Comparison of Different Technologies and Status of their Development in India

S. No.	Technology	Worldwide Status	Status in India
A.	PC Firing with SO _x and NO _x Control system	Commercialized	NO _x Control commercialized
B.	AFBC Power Plant	Commercialized up to 165 MWe (USA)	2 x 10 MWe units operating
C.	CFBC Power Plant	Commercialized up to 250 MWe (France)	1 x 30 Mile unit commissioned by BHEL – LURGI Maharashtra (1997)
D.	PFBC Power Plant	Demonstration units up to 130 MWe (Sweden, Spain, USA, Japan)	Bench scale R&D at BHEL and IIT Madras
E.	(i) IGCC Power Plant	Demonstration units up to 250 MWe (USA, Netherlands)	6.2 MWe demo plant at BHEL, 600 MWe Conceptual design at IICT Hyderabad; Gasifier pilot plants at BHEL and IICT; Proposal for a 250 MWe demo plant by CSIR with the Government
	(ii) Hybrid IGCC Power Plant	Pilot Plant R&D (UK)	No activity
F.	Fuel Cell based PFBC Power Plant	Advanced R&D	On-going R&D in fuel cells

Supercritical Boiler Technology is commercialized in several countries with overall plant efficiencies of 43 – 45% and with DENOX and DESOX systems. There is negligible interest in India in the technology at present. Slagging combustion technology has the special feature of burning high ash coal at very high temperatures in a primary chamber, where molten ash slag can be removed before allowing almost ash -free hot gases to enter a secondary chamber to generate steam. After laboratory scale studies, this technology has been abandoned because of the inadequate flowing ability of Indian molten ash.

Control technology for petcoke use

Petroleum coke is a challenging fuel in terms of its low volatile content, high sulphur and nitrogen content, which give rise to undesirable emission characteristics. However, the low price and increased production of petroleum coke from high-sulphur feedstock gives a powerful economic stimulus to use it for power generation. The clean combustion of petroleum coke is focused on removal of CO₂ and sulphur. The high carbon content and low moisture content of petroleum coke ensure high purity of the CO₂ stream. The low ash content is also important since it reduces the possibility of ash fusion in the calciner. It also reduces the heat loss and the requirement for ash disposal, and hence contributes to high overall efficiency. Simulation results show that high efficiency can be achieved with incorporation of the proposed scheme for power generation, even after the penalty of CO₂ recovery. Thus, there is a potential for using abundantly available, low-cost, but environmentally challenging petroleum coke as fuel for clean combustion and power generation.

Choice of energy fuel

The simplest and, in many circumstances, most cost-effective form of pollution prevention is to use cleaner fuels. For new power plants, burning natural gas currently has a decisive advantage in terms of their capital costs, thermal efficiency, and environmental performance. Natural gas is also a preferred fuel for minimising green house gas (GHG) emissions because it produces lower CO₂ emissions per unit of energy and enhances energy efficiency. If availability or price rules out natural gas as an option, the use of low-sulphur fuel oil or high-heat content, low-sulphur, low-ash coal should be considered. Typically, such fuels command a premium price over their dirtier equivalents, but the reductions in operating or environmental costs that they permit are likely to outweigh this premium. In preparing projects, an evaluation of alternative fuel options should be conducted at the outset to establish the most cost-effective combination of fuel, technology, and environmental controls for meeting performance and environmental objectives.

If coal is used, optimal environmental performance and economic efficiency will be achieved through an integrated approach across the whole coal-energy chain, including the policy and investment aspects of mining, preparation, transport, power generation, heat conversion, and clean coal technologies. Coal washing, in particular, has a beneficial impact in terms of reducing the ash content and ash variability of coal used in TPPs, which leads to consistent boiler performance, reduced emissions, and less maintenance.

Pet-coke fuel

Petroleum coke (often abbreviated petcoke) is a carbonaceous solid derived from oil refinery coker units or other cracking processes. Pet-coke is a by-product of petroleum refining. It is a carbonaceous solid residual by-product of the oil refining coking process. As crude oil is refined, lighter fractions or products, such as gasoline and jet fuel, are driven off leaving a residual oil of relatively little value. In refineries with cokers, this residual oil is processed further to yield additional amounts of light products, along with petroleum coke. Over 75% of the pet-coke produced is considered to be fuel grade and has about 15% higher heating value than coal.

Some 40 to 60% of the sulphur in the oil feedstock remains in coke, which means that the sulphur content of this refinery by-product is usually quite high. While the actual amount of sulphur in coke varies depending on the sulphur in the crude oil entering the refinery, the sulphur content of coke typically ranges from 4 to 8 % much greater than even high-sulphur coal. Therefore, control of sulphur emissions is very important when using petcoke as a fuel.

Though, its high heat and low-ash content make it a good fuel for power generation in coal fired boilers, but petroleum coke is high in sulphur and low in volatile content, which pose some environmental and technical problems with its combustion. In order to meet current North American emission standards, some form of sulphur capture is required.

Circulating fluidized beds

Circulating fluidized beds burn various types of fuels without violating emission-control norms. This makes CFBs suitable for burning fuels - high-sulphur coal, lignite, peat, oil,

sludge, petroleum coke, gas and wastes - cleanly and economically in CFB boilers. This technology does away with the need for complex scrubbers, catalytic systems or other costly chemical clean-up systems.

According to the international monitoring, fluidized-bed combustion evolved from efforts to find a combustion process able to control pollutant emissions without external emission controls (such as scrubbers). The technology burns fuel at temperatures of 1,400 to 1,700 degrees Fahrenheit (°F), well below the threshold where nitrogen oxides form (at approximately 2,500 °F, the nitrogen and oxygen atoms in the combustion air combine to form nitrogen oxide pollutants).

The mixing action of the fluidized bed brings the flue gases into contact with a sulphur-absorbing chemical, such as limestone or dolomite. More than 95% of the sulphur pollutants in coal can be captured inside the boiler by the sorbent.

The popularity of fluidized bed combustion is largely due to the clean coal technologies, fuel flexibility - almost any combustible material, from coal to municipal waste, can be burned - and the capability of meeting sulphur dioxide and nitrogen oxide emission standards without the need for expensive add-on controls.

The clean coal technology programme led to the initial market entry of 1st generation pressurized fluidized bed technology, with an estimated 1,000 MW of capacity installed worldwide. These systems pressurise the fluidized bed to generate sufficient flue gas energy to drive a gas turbine and operate it in a combined-cycle, the DoE report adds.

3.2.3 Environmental impacts of power plants

The impacts of TPPs on the environment are influenced processes used and the location characteristics in different ways. The Plant processes and major pollution sources are depicted in Figure 3-1.

Coal-based power plants significantly impact the local environment. Direct impacts resulting from construction and ongoing operations include:

- Ambient Air Pollution – particulates, sulphur oxides, nitrous oxides, and other hazardous chemicals and toxic metals like Hg, As, *etc.*
- Water Pollution – occurs in local water streams, rivers and ground water from effluent discharges and percolation of hazardous materials from the stored fly ash
- Land Degradation – occurs due to alterations of land used for storing fly ash
- Noise Pollution – during operation and cause occupational as well as public health hazards

The indirect impacts result mainly from coal mining, which includes degradation and destruction of land, water, forests, habitats, and societies. In addition to the impact of the coal-power plants, there is also a larger issue of the environmental and social impact of coal mining. In a typical TPP, environmental impacts are likely to comprise the following principal components:

- transportation of raw material
- preparing and storing raw material
- burning fuel and generating steam
- generating electricity and available heat
- treating exhaust gases and solid and liquid residues

- cooling infrastructures
- safe handling and disposal of wastes

Air Environment

Initially, perceptions of objectionable effects of air pollutants were limited to those easily detected like odour, soiling of surfaces and smoke stacks. Later, it was the concern over long-term/chronic effects that led to the identification of six criteria pollutants. These six criteria pollutants are sulphur di-oxide (SO₂), Carbon Mono-oxide (CO), Nitrogen oxide (NO₂), Ozone (O₃), suspended particulates and non-methane hydrocarbons (NMHC) now referred to as volatile organic compounds (VOC). There is substantial evidence linking them to health effects at high concentrations. Three of them namely O₃, SO₂ and NO₂ are also known phytotoxicants (toxic to vegetation). In the later part Mercury (Hg) has been added to that list.

Nitrogen Oxide (NO_x): Most of the NO_x is emitted as NO which is oxidised to NO₂ in the atmosphere. All combustion processes are sources of NO_x at the high temperature generated in the combustion process. Formation of NO_x may be due to thermal NO_x, which is the result of oxidation of nitrogen in the air due to fuel NO_x which is due to nitrogen present in the fuel. Some of NO₂ will be converted to NO₃ in the presence of O₂. In general, higher the combustion temperature the higher NO_x is produced. Some of NO_x is oxidised to NO₃, an essential ingredient of acid precipitation and fog. In addition, NO₂ absorbs visible light and in high concentrations can contribute to a brownish discoloration of the atmosphere.

Sulphur Oxide: The combustion of sulphur containing fossil fuels, especially coal is the primary source of SO_x. About 97 to 99% of SO_x emitted from combustion sources is in the form of Sulphur Di-oxide, which is a criteria pollutant, the remainder is mostly SO₃, which is in the presence of atmospheric water is transformed into Sulphuric Acid at higher concentrations, produce deleterious effects on the respiratory system. In addition, SO₂ is phytotoxicant.

Particulate matter: The terms particulate matter, particulate, particles are used interchangeably and all refer to finely divided solids and liquids dispersed in the air.

Mercury Emissions: Mercury can be emitted in three different forms *viz.*, elemental (Hg⁰), oxidized (Hg²⁺) and particle bound (HgP). Upon combustion, coal fly ash tends to have a higher concentration of mercury, and estimates indicate that Indian coal ash has an average mercury concentration of 0.53 mg/kg, based on measurements from a few selected power plants. The details on mercury emission status & control technology **Annexure I** may be referred.

Water environment

Water pollution refers to any change in natural waters that may impair further use of water, caused by the introduction of organic or inorganic substances or a change in temperature of the water. In thermal power stations, the source of water is either river, lake, pond or sea where from water is usually taken. There is a possibility of water being contaminated from the source itself. Further contamination or pollution could be added by the pollutants of thermal power plant waste as inorganic or organic compounds.

Land degradation

The thermal power stations are generally located on the non-forest land and do not involve much resettlement and rehabilitation problems. However its effects due to stack emission etc, on flora and fauna, wild life sanctuaries and human life *etc.*, have to be studied for any adverse effects. One of the serious effects of thermal power stations is land requirement for ash disposal and hazardous elements percolation to ground water through ash disposal in ash ponds. Due to enormous quantity of ash content in Indian coal, approximately Acre per MW of installed thermal capacity is required for ash disposal. According to the studies carried out by International consultants if this trend continues, by the year 2014 -2015, 1000 sq. km of land should be required for ash disposal only.

Noise pollution

Some areas inside the plant will have noisy equipments such as crushers, belt conveyors, fans, pumps, milling plant, compressors, and boiler, turbine *etc.* Various measures may be taken to reduce the noise generation and exposure of workers to high noise levels in the plant area will generally include:

- Silencers of fans, compressors, steam safety valves, *etc*
- Using noise absorbent materials
- Providing noise barriers for various areas
- Noise proof control rooms
- Provision of green belt around the plant will further reduce noise levels

Thermal power stations in India, where poor quality of coal is used, add to environmental degradation problems through gaseous emissions, particulate matter, fly ash and bottom ash. Growth of manufacturing industries, in public as well as private sectors has further aggravated the situation by deteriorating the ambient air quality. Abundance of ash content in Indian coal results in increase of fly ash and bottom ash content for disposal. The fly ash generated in thermal power station causes many hazardous diseases like asthma, tuberculosis, *etc.* Table 3-8 indicates the potential emissions from a TPP.

Table 3-8: Potential Emissions from a TPP

Type of Emission	Process Stage/Operation					
	Fuel Storage and Processing	Combustion and Steam Generation	Flue gas Cleaning (if any)	Power Generation	Cooling Systems	Treatment of Residue
Particulates	*	*			*	*
Noxious gases		*				*
Wastewater	*	*	*		*	*
Solid Residues		*	*			*
Waste heat		*		*	*	
Noise	*	*	*	*	*	*
Groundwater contamination	*			*		

Occupational Health and Safety Concerns

Occupational health and safety performance should be evaluated against industrial hygiene exposure guidelines, of which examples include the Threshold Limit Value (TLV®)

Occupational exposure guidelines, United States National Institute for Occupational Health and Safety (NIOSH), Permissible Exposure Limits (PELs) published by the Occupational Safety and Health Administration of the United States (OSHA), Indicative Occupational Exposure Limit Values published by European Union member states, or other similar sources. Additional indicators specifically applicable to electric power sector activities include the ICNIRP exposure limits for occupational exposure to electric and magnetic fields.

Trans-boundary Impacts

Emissions from thermoelectric projects can act as precursors of acid precipitation, particularly when coal with its high sulphur content is the fuel. Acid precipitation accelerates the deterioration of buildings and monuments, radically alters aquatic ecosystems of certain lakes, and damages vegetation in forest ecosystems. The combustion of fossil fuel in thermoelectric plants also generates CO₂, NO. Global warming has been attributed to increases in CO₂ and NO in the atmosphere. However, it is currently impossible to predict the exact contribution of specific emissions from a particular thermoelectric project to these regional and global problems.

Global Warming Concerns

It is predicted that, due to current trends of GHG rising, the average surface temperature in India will increase between 2.3 to 4.8°C for a doubling of pre-industrial CO₂ levels (Dinar *et al.*, 1998 and shall have significant implications such as changes in monsoon precipitation patterns as well as rise in extreme rainfall events, coastal storms, and droughts. Such changes in the climate could have enormous human, ecological, and economic impacts on the country. So given that the country has about 7000 km of coastline global warming is an important issue for India, given the range and magnitude of the possible impacts.

The carbon intensity of the Indian energy economy (carbon emission per unit energy use) has risen significantly over the past two decades, presumably because commercial, fossil-based, energy supplies have been contributing a greater share to the overall energy supply. Though, overall, the carbon intensity of the Indian economy remains relatively low but, still India's overall CO₂ emissions have been increasing at a compounded annual growth rate of 4.9% from 1990 to 2003 (Marland *et al.*, 2005), in comparison to ~4.5% for China, ~1.6% of US, and ~1.5% globally. More recently (from 2000 to 2004), India's emission growth rate slowed down to 3.8%, as has the U.S. with 0.3%; however, Chinese emission rates increased dramatically to 10.7% over this period (Marland *et al.*, 2007). Moreover, India's contribution to annual global emissions remained at about 4.5% between 1999 and 2004; in contrast, China's contribution increased from 13% in 2000 to 17% in 2004 (Marland *et al.*, 2007).¹⁸⁷ Thus, although India is now the 4th largest emitter of CO₂ worldwide, its total emissions are still about 1/5th and 1/3rd of U.S. and China, respectively. Furthermore, India's carbon emissions on a per capita basis are almost 1/20th that of the United States and less than half that of China. There fore, it is logical that India should have significant headroom for GHG emissions growth as its economy grows.

Though, India has no commitments yet under Kyoto Protocol, although there are a range of ongoing GHG-mitigation projects in the country under the umbrella of CDM. As TPP have emerged as the major source of GHG, the early considerations of various options to reduce the country's GHG emissions, especially from the coal-power TPP, would be warranted. The various options in reducing overall GHG emissions under trial include (a) reducing energy demand through conservation and lifestyle changes, (b) increasing efficiency of energy conversion and end-use processes, (c) switching to less carbon-intensive fuels (renewables, natural gas, *etc.*), (d) capturing and storing CO₂ from emission sources, and (e) sequestering atmospheric CO₂ by enhancing the natural sinks such as forests, *etc.*

3.2.4 Qualitative and quantitative analysis of rejects

Air Emissions

The particulate and noxious gas emissions from TPPs primarily and directly pollute the air. Eventually, the particulate emissions and, for the most part, the noxious gases and any atmospheric transformation products that may have formed (*e.g.*, NO₂ and nitrate from NO) fall to earth either by a way of precipitation or by dry deposition, thereby imposing a burden on the water and/or soil, with resultant potential damage to flora and fauna.

Depending on the fuel employed (type, composition, calorific value) and the type of combustion (*e.g.*, dry or slag-tap firing), given amounts of pollutants (particulates, heavy metals, SO_x, NO_x, CO, CO₂, HCl, HF, organic compounds) become entrained in the exhaust gases. Table 3-9 shows the potential concentration ranges of different emissions for various fuels in facilities in the absence of flue-gas emission control measures.

Table 3-9: Potential Ranges of Pollutant Concentration Levels in Untreated Gas Type of Fuel

Type of Emission	Natural Gas	Light Fuel Oil	Heavy Fuel Oil	Hard Coal	Lignite (Brown Coal)
Sulphur Oxides (SO _x) [mg/m ³ STP]	20-50	300-2000	100-10000	500-800	500-18000
Oxides of Nitrogen (NO _x) [mg/m ³ STP]	100-1000	200-1000	400-1200	600-2000	300-800
Particulates [mg/m ³ STP]	0-30	30-100	50-1000	3000-40000	3000-50000
Heavy Metals					

The above table lists the noxious emissions in mg/m³ STP as flue gas standards prevailing in EU countries. SO_x and NO_x are postulated as SO₂ and NO₂. Some emissions are limited in terms of mass flow, *e.g.*, in kilogram per hour (kg/h), or of minimum separation efficiency. With a view to enabling conversion of the stated concentrations to other units such as parts per million (ppm), g/GJ or pounds (lb) of pollutant per 106 BTU energy input, as commonly employed in the U.S.A

The ranges quoted in Table 3-9 for oxides of sulphur relate to differences in fuel-specific sulphur content, whereas in India large quantities of indigenous fuels have comparatively

low-calorific values as well as low sulphur coal. Such a combination naturally produces low SO_x concentrations in the (untreated) flue gas.

The lesser part of the NO_x concentrations derives from the nitrogen content of the fuel (fuel NO_x). The major share results from the oxidation of atmospheric nitrogen at combustion temperatures exceeding 1200°C (thermal NO_x). Consequently, high combustion temperatures go hand in hand with relatively high NO_x emission levels. Appropriate combustion engineering measures that are relatively inexpensive for new plants can keep the emissions at the lower end of the respective range. However, care must be taken to ensure that a high quality of combustion is maintained. Otherwise, excessive combustion engineering measures aimed at reducing NO_x emissions could result in a disproportionate increase in other emissions, *e.g.*, CO and combustible (unburned) hydrocarbons.

In general, CO₂ emissions are mainly limited by controlling the burnout process such as to minimise the discharge of CO and the escape of combustible hydrocarbons. Unlike particulates, SO₂, NO_x and halogen compounds, CO and combustible hydrocarbons effectively defy retentive measures. Combustible hydrocarbons, in particular, include numerous chemical substances that can cause toxicological problems, *e.g.*, benzpyrene.

Plants fueled with coal or heavy fuel oil also emit small amounts of hydrogen chloride and hydrofluoric acid (HCL and HF) ranging from 50 to 300 mg/m³ STP. As a rule, the concentrations stay well below the SO₂ levels and respond favourably to desulphurization processes, by which they are reduced even more than S₂. There are many combustion-stage and post-combustion alternatives for use in reducing air pollution from TPPs which are discussed later.

Noise

Noise is another air pollution and the principal source of noise in a TPP includes the turbine generators and auxiliaries; boilers and auxiliaries, such as coal pulverisers; reciprocating engines; fans and ductwork; pumps; compressors; condensers; precipitators, including rappers and plate vibrators; piping and valves; motors; transformers; circuit breakers; and cooling towers. TPPs used for base load operation may operate continually while smaller plants may operate less frequently but still pose a significant source of noise if located in urban areas.

Water and Wastewater

The wastewater streams in a TPP include cooling tower blow down; ash handling wastewater; material storage runoff; metal cleaning wastewater; and low-volume wastewater, such as air heater and precipitator wash water, boiler blow down, boiler chemical cleaning waste, floor and yard drains and sumps, laboratory wastes, and backflush from ion exchange boiler water purification units. Such wastewater is usually generated in power plants which burn coal or biomass. Some of these streams (*e.g.*, ash handling wastewater) may be generated in reduced quantities or may not be present at all in oil-fired or gas-fired power plants. The characteristics of the wastewaters generated depend on the ways in which the water is used. Contamination arises from demineralisers, lubricating and auxiliary fuel oils, chlorine, biocides, and other chemicals used to manage the quality of water in cooling systems. Cooling tower blow down tends to be very high in total dissolved solids but is generally classified as non-contact cooling water and, as such, is typically subject only to limits for pH and residual chlorine.

In Oil or Gas-based TPP, the same wastewater sources are usually present in plants except some of these streams (e.g., ash handling wastewater) may not be present at all. Apart from their cooling-water consumption, power plants have very modest water requirements (0.1 - 0.3 m³/h•MWel).

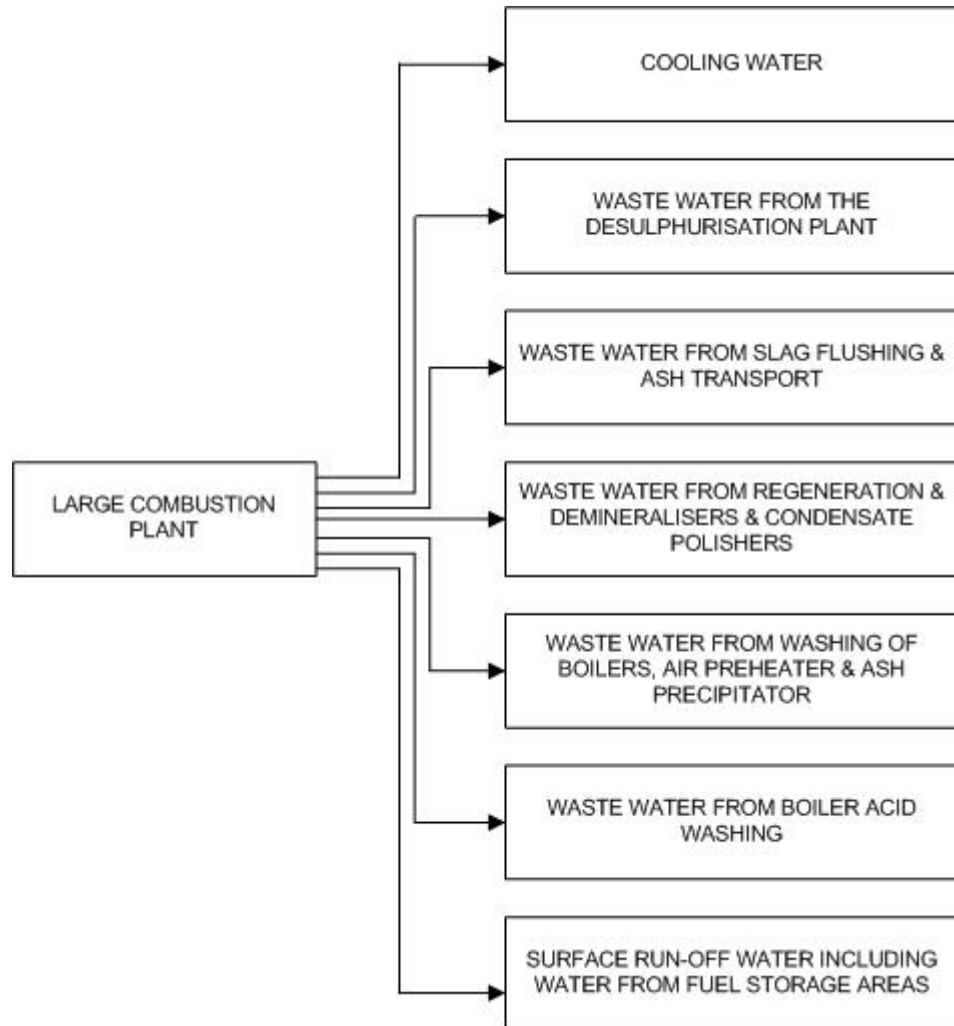

Figure 3-4: Major Sources of Wastewater from TPP

The discharges may cause water quality problems, which vary widely, depending on the type of fuel used, the abatement technique applied, the cooling technique and consequently the amount of water used, and the chemical and biological treatment reagents added for cleaning and maintenance purposes. The constituents of wastewater are wide and include:

Temperature, pH, TOC, Colour, TDS, BOD, COD, N (total), Mineral oils, Free chlorine, NH₃, Fish, toxicity, Sb, PAH Metals (Co, Mn, Tl, V, Sn, Cd, Cr, Ni, Cu, Hg, Pb, Zn, etc.) CN, S, SO₃, SO₄, EOX, Phenol, PCDD/PCDF, P (total) TSS, Cl⁻, FAs, BTEX etc.

Because of their physical, chemical and biological characteristics, release of such compounds may have a high impact on the aquatic environment. These substances can impart significant toxicity to the receiving water. For instance, water from slag flush and ash transport has an alkaline character due to the composition of the ash, whereas water

from boiler washing is acidic. Wastewater from the wet desulphurisation plant contains salts such as chlorides and sulphates. Salt derived from the sea is found in most coastal waters. However, discharges from industrial activities such as energy generating facilities provide a further source of salt. This effect is even more significant if the water is discharged to a river or lake.

Two sources of wastewater from TPP are cooling water and wastewater generated from other processes.

Cooling Water Sources and Issues: TPP with steam-powered generators and once-through cooling systems use significant volume of water to cool and condense the steam for return to the boiler. The heated water is normally discharged back to the water source (*i.e.*, river, lake, estuary, or the ocean) or the nearest surface water body, although it does not immediately mix with the source/receiving water bodies. Typical cooling systems used in TPPs include:

- once-through cooling system where sufficient cooling water and receiving surface water are available
- closed circuit wet cooling system
- closed circuit dry cooling system (*e.g.* air cooled condensers)

Power plants designed for non-circulating water cooling require about 160 - 220 m³/h•MWel (with cooling water losses usually staying below 2%).

In a TPP, the cooling water absorbs approximately 60% to 80% of the fuel's energy content as waste heat. Less energy is wasted by plants with inherently higher efficiency, *e.g.*, cogenerating facilities. Depending on local conditions, the waste heat can impose a thermal burden on surface water, *e.g.*, an increase in the temperature of a river, with the volumetric flow and/or water regimen as an actuating variable. Particularly in our country, water bodies are subject to pronounced seasonal variation. Oxygen depletion therefore has two main causes—accelerated consumption due to rapid metabolism, and lower solubility of oxygen in warm water. Oxygen deficiency can be seriously detrimental to aquatic life.

The in/out temperature gradient of cooling water can be limited by putting it through a cooling tower (once-through or circulation cooling) before it is returned to the river. Depending on the prevailing climatic conditions; however, such cooling systems involve major evaporative water losses and, hence, locally elevated atmospheric dampness. Such problems can be minimised by the use of a closed-loop cooling systems in combination with dry or hybrid cooling towers. Natural-draft cooling towers are relatively expensive to build, but comparatively inexpensive to operate. The induced-draft cooling towers have the disadvantage of operating on electricity, the generation of which increases the overall ecological burden.

Intakes and Discharge Point Issues: The withdrawal of such large quantities of water and discharge with elevated temperature along with various pollutants, chemical contaminants picked up during process such as biocides or other additives, if used for controlling bio-growth, may affect aquatic organisms, including phytoplankton, zooplankton, fish, crustaceans, shellfish, and many other forms of aquatic life. Cooling tower blowdown tends to be very high in total dissolved solids, but is generally classified as non-contact cooling water and, as such, is typically subject only to limits for pH and residual chlorine.

Intake Point: Aquatic organisms drawn into cooling water intake structures are either impinged on components of the cooling water intake structure or entrained in the cooling water system itself. In case of either impingement or entrainment, aquatic organisms may be killed or subjected to significant harm. In some cases (*e.g.*, sea turtles), organisms are entrapped in the intake canals. There may be special concerns about the potential impacts of cooling water intake structures located in or near habitat areas that support threatened, endangered, or other protected species or where local fishery is active.

Conventional intake structures include traveling screens with relative high through-screen velocities and no fish handling or return system. Measures to prevent, minimise, and control environmental impacts associated with water withdrawal should be established based on the results of a project EA, considering the ecological characteristics of the project affected area.

Recommended management measures to prevent or control impacts to aquatic habitats include:

- Reduction of maximum through-screen design intake velocity to 0.5 feet per second (ft/s);
- Reduction of intake flow to a level commensurate with a closed-cycle recirculating cooling water system;
- Reduction of intake flow to the following levels:
 - For freshwater rivers or streams, to a flow sufficient to maintain resource use (*i.e.*, irrigation and fisheries) as well as biodiversity during annual mean low flow conditions
 - For lakes or reservoirs, intake flow must not disrupt the thermal stratification or turnover pattern of the source water
 - For estuaries or tidal rivers, reduction of intake flow to 1% of the tidal excursion volume
- If there are threatened, endangered, or other protected species within the hydraulic zone of influence of the intake, reduction of impingement and entrainment of fish and shellfish can be reduced by the installation of barrier nets (seasonal or year-round), fish handling and return systems, fine mesh screens, wedge wire screens, and aquatic filter barrier systems. Examples of operational measures to reduce impingement and entrainment include seasonal shutdowns or reductions in flow or continuous use of screens. Designing the location of the intake structure in a different direction or further out into the water body may also reduce impingement and entrainment.

Discharge Point: After absorbing enough heat to raise its temperature by 4 - 8°C, the water normally is returned to the extraction point or is released to some receiving water body. Thermal discharges should be designed to prevent negative impacts to the receiving water taking into account the following criteria:

- The elevated temperature areas because of thermal discharge from the project should not impair the integrity of the water body as a whole or endanger sensitive areas (such as recreational areas, breeding grounds, or areas with sensitive biota);
- There should be no lethality or significant impact to breeding and feeding habits of organisms passing through the elevated temperature areas;
- There should be no significant risk to human health or the environment due to the elevated temperature or residual levels of water treatment chemicals. If a once-

through cooling system is used for large projects, impacts of thermal discharges should be evaluated in the EIA with a mathematical or physical hydrodynamic plume model, which can be a relatively effective method for evaluating a thermal discharge to find the maximum discharge temperatures and flow rates that would meet the environmental objectives of the receiving water. Recommendations to prevent, minimise, and control thermal discharges include:

- Use of multi-port diffusers
- Adjustment of the discharge temperature, flow, outfall location, and outfall design to minimise impacts to acceptable level (*i.e.*, extend length of discharge channel before reaching the surface water body for pre-cooling or change location of discharge point to minimise the elevated temperature areas)
- Use of a closed-cycle, recirculating cooling water system (*e.g.*, natural or forced draft cooling tower), or closed circuit dry cooling system (*e.g.*, air cooled condensers) if necessary to prevent unacceptable adverse impacts

Liquid Wastes from Other Processes

The mitigation measures for non-cooling tower discharges include:

- Recycling of wastewater from flue gas desulphurisation (FGD) systems in coal-fired plants as FGD makeup. This practice not only eliminates this wastewater stream but also conserves water;
- In coal-fired power plants without FGD systems, treatment of process wastewater in conventional physical-chemical treatment systems for pH adjustment and removal of total suspended solids (TSS), at a minimum.
- Depending on local regulations, these treatment systems can also be used to remove heavy metals to parts per billion (ppb) levels by chemical precipitation as either metal hydroxide or metal organo-sulfide compounds;
- Collection of fly ash in dry form and bottom ash in drag chain conveyor systems in a new coal-fired power plants;
- Consider use of soot blowers or other dry methods to remove fireside wastes from heat transfer surfaces so as to minimize the frequency and amount of water used in fireside washes;
- Use of control measures such as protective liners and collection and treatment of runoff from coal piles;
- Spraying of coal piles with anionic detergents to inhibit bacterial growth and minimize acidity of leachate;
- Use of SO_x removal systems that generate less wastewater, if feasible; however, the environmental and cost characteristics of both inputs and wastes should be assessed on a case-by-case basis;
- Treatment of low-volume wastewater streams that are typically collected in the boiler and turbine room sumps in conventional oil-water separators before discharge;
- Treatment of acidic low-volume wastewater streams, such as those associated with the regeneration of makeup demineraliser and deep-bed condensate polishing systems, by chemical neutralization in-situ before discharge;
- Pretreatment of cooling tower makeup water, installation of automated bleed/feed controllers, and use of inert construction materials to reduce chemical treatment requirements for cooling towers;

- Elimination of metals such as Chromium and Zinc from chemical additives used to control scaling and corrosion in cooling towers;
- Use the minimum required quantities of chlorinated biocides in place of brominated biocides.

Sanitary Wastes

Sanitary wastewater from industrial facilities may include effluents from domestic sewage, food service, and laundry facilities serving site employees. Miscellaneous wastewater from laboratories, medical infirmaries, water softening, *etc.*, may also be discharged to the sanitary wastewater treatment system.

Solid/Hazardous Waste

Solid Waste: Coal or biomass-fired TPPs generate the greatest amount of solid wastes in India due to the relatively high percentage of fly ash in the fuel. The other solid waste from large-volume coal combustion wastes includes bottom ash, boiler slag. At this stage FGD is not common and hence, FGD sludge is not a common solid waste because Indian coal contains less sulphur; therefore FGD may not be necessary. Fluidized-bed combustion (FBC) boilers generate fly ash and bottom ash, which is called bed ash. Fly ash removed from exhaust gases makes up more than 60–85% of the coal ash residue in pulverised-coal boilers. Bottom ash includes slag and particles that are coarser and heavier than fly ash. Due to the presence of sorbent material, FBC wastes have relatively higher content of Calcium and sulfate and a lower content of silica and alumina than conventional coal combustion wastes. Low-volume solid wastes from coal-fired TPPs and other plants include coal mill rejects/pyrites, cooling tower sludge, wastewater treatment sludge, and water treatment sludge. Oil combustion wastes also include fly ash and bottom ash, but are generated in significant quantities when residual fuel oil is burned in oil-fired steam electric boilers. Other technologies (*e.g.*, combustion turbines and diesel engines) and fuels (*e.g.*, distillate oil) generate little or no solid wastes. Overall, oil combustion wastes are generated in much smaller quantities than the large-volume coal fired discussed above. Gas-fired TPPs generate virtually no solid waste because of the negligible ash content, regardless of the combustion technology.

Fly ash generated is typically not classified as a hazardous waste due to its inert nature. However, it may be enriched with metals being constituents of concern in both coal fired and low-volume solid wastes as a result ash residues and the dust removed from exhaust gases may contain significant levels of heavy metals and some organic compounds, in addition to inert materials. Therefore, where ash residues are expected have potentially significant levels of heavy metals or other potentially hazardous materials, they are required to be tested at the start of plant operations to verify their classification as hazardous or non-hazardous according to National Hazardous Waste rules.

Hazardous Waste: Hazardous materials and petroleum products stored and used at combustion facilities include solid, liquid, and gaseous fuels; air, water, and wastewater treatment chemicals; and equipment and facility maintenance chemicals (*e.g.*, paint, lubricants, and cleaners). The other sources of hazardous materials are petroleum, including spills during transport and storage.

Fly Ash and Bottom Ash: Indian coal has general properties of the Southern Hemisphere Gondwana coal, which has interbanded seams with mineral sediments (IEA, 2002a). Therefore, much of the coal is of low-calorific value with high ash content. Run-of-mine

coals typically have ash content ranging from 40-50%, with low iron content and negligible toxic trace elements and gross calorific value varies between 2500 – 5000 kcal/kg, with non-coking steam coal being in the range of 2450 – 3000 kcal/kg (Visuvasam et al., 2005). In addition the quality of Indian coal has gotten worse over the past decades. The ash generated by TPP is of three kinds (Govil 1998):

- Bottom ash – ash that is settled at the bottom of the boiler, and is generally evacuated out as slurry (10-20% of total).
- Coarse fly ash – ash that is collected at the first stage of the ESP. It contains small ash chunks with carbon content around 6-7%, and is generally useful for the brick manufacturing industry (70-80% of total).
- Fine fly ash – fine ash that is collected by the later electrostatic precipitator (ESP) stages. This fine ash is either removed dry or as a slurry and put in ash yards and ponds (5-7% of total).

As a consequence of high ash content in Indian coals, the land requirement has become very high around one acre for one MW of installed capacity (CEA, 2004b), and many large power plants (more than 4000 MWs) require extremely high land just for ash storage. Over the past decade, 1.4-1.5 million tons of ash was annually produced per GW of installed capacity (CEA, 2005e), with the number increasing slightly over time because of increasing ash content in coal and increasing PLF. The fly ash generation and utilization over the past decade is depicted in Figure 3-5.

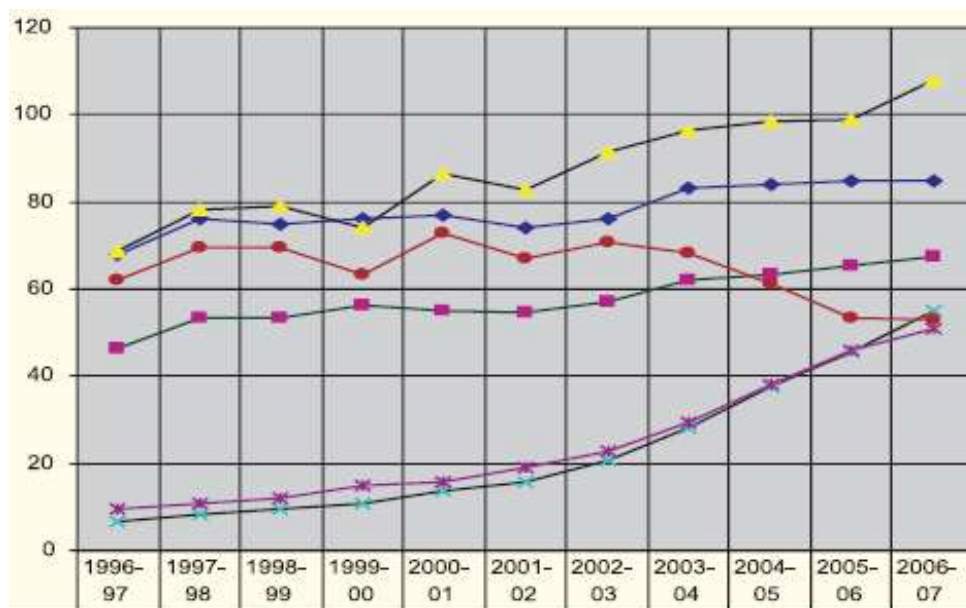

Figure 3-5: Progressive Ash Generation and Utilization of Coal/Lignite-based Thermal Stations

The ash in ash pond is stored even more than 30m in height. After the ash pond is completely “filled”, the power plant must ‘reclaim’ the pond by landscaping it and covering with vegetation. Fly ash utilization has increased ten-fold from 1992-93 to 2003-04, and about 30% of the generated ash is utilized today. This dramatic improvement in fly ash utilization is primarily a result of following two MoEF’s policies and guidance.

- In order to increase fly-ash utilization, the MoEF in 1999 mandated a 100% utilization of fly ash in a phased manner by 2013-14. It has stipulated that fly ash from power plants be given free (at least until 2010) to brick and cement manufacturers within 50 km radial distance from power plants; these manufacturers have also been given specific targets for ash utilization (MoEF, 1999; CEA, 2005e).
- In 1997, the MoEF mandated the use of beneficiated coals with ash content of 34% (or lower) in power plants located beyond 1000 km from their coal source, and plants located in critically polluted areas, urban areas, and ecologically sensitive areas (CPCB, 2000b).

3.2.5 Exposure pathways

Exposure pathway is the path due to which exposure of the receptor takes place. The “Exposure” has been defined as contact with a chemical or physical agent. It is the process by which an organism acquires a dose (Suter, 1993). The estimation of exposure of a target organism requires an exposure scenario that answers to four questions (Suter, 1993):

- given the output of fate models (see section on mass balance equation for water quality), which media (ecosystem components) are significantly contaminated;
- to which contaminated media are the target organisms exposed;
- how are they exposed (pathways and rates of exposure); and
- given an initial exposure, will the organism modify its behaviour to modify exposure pathways or rates (attraction or avoidance)?

For Environmental Risk Management there are three major risk factors and exposure Pathway is one of three factors. To determine whether risk management actions are warranted, the following assessment approach should be applied to establish whether the three risk factors of ‘Contaminants’, ‘Receptors’, and ‘Exposure Pathways’ co-exist, or are likely to co-exist, at the project site after the operational phase of the proposed development.

- Contaminant(s): Presence of pollutants and/or any hazardous materials, waste, or oil in any environmental media at potentially hazardous concentrations
- Receptor(s): Actual or likely contact of humans, wildlife, plants, and other living organisms with the contaminants of concern
- Exposure Pathway(s): A combination of the route of migration of the contaminant from its point of release (*e.g.*, leaching into potable groundwater) and exposure routes

Table 3-10 identifies some of the major exposure pathways.

Table 3-10: Exposure Pathways

Media	Pathways	Comment
Air-Gases and Aerosols	Respiration	Assuming accurate fate model estimates, exposure is relatively predictable based on assumption of homogenous distribution in air
Water – Soluble Chemicals	Respiration	Assuming accurate fate model estimates, exposure is relatively predictable based on assumption of homogenous distribution in water

Media	Pathways	Comment
Sediment (Solids and pore water)	Benthic animals absorb chemicals, respire pore water or food or food from the water column. Plants rooted in the sediment may take up material from sediments, surface water and air	Processes are very complicated and usually simplifying assumptions are required
Soil (solids, pore water and pore air)	Organisms in soils may absorb material from soil, pore water, pore air, ingest soil, soil – associated food.	Processes are very complicated and usually simplifying assumptions are required.
Ingested Food and Water	Consumption by fish and wildlife	Assume the test animal consumption rates in laboratory for a given availability of food or water are the same as those occurring naturally in the environment.
Multimedia	More than one of the above pathways	It is often possible to assume one pathway is dominant. In some cases, it will be necessary to estimate the combined dosage.

TPP emissions or rejects (gaseous, solid & hazardous as well as liquid effluents) can cause damage to human health, aquatic and terrestrial ecology as well as material due to various exposure routes (pathways). For example adverse effects of TPPs on human health can derive from the direct impact of noxious gases on the organism and/or their indirect impact via the food chain and changes in the environment. Especially in connection with high levels of fine particulates, noxious gases like SO₂ and NO_x can lead to respiratory diseases. SO₂ and NO_x can have health-impairing effects even at concentrations below those of standard of 120 µg/m³. The duration of exposure is decisive. Injurious heavy metals (*e.g.*, lead, mercury and cadmium) can enter the food chain and, hence, the human organism by way of drinking water and vegetable and animal products. Climatic changes such as warming and acidification of surface waters, Forest depletion can occur due to acid rain and/or the greenhouse effect of CO₂ and other trace gases can have long-term detrimental effects on human health. Similarly important are the effects of climatic changes on agriculture and forestry (and thus on people's standard of living), *e.g.*, large-scale shifts of cultivation to other regions and/or deterioration of crop yields due to climate change impacts. Hence, the construction and operation of TPPs can have both socioeconomic and socio-cultural consequences; appropriate preparatory studies, gender-specific and otherwise, are therefore required, and the state of medical services within the project area must be clarified in advance. Beside, noise pollution generated from turbines is an important source of occupational exposure, has direct effects on humans and animals. The main sources of noise in a power plant are: the mouth of the smokestack, belt conveyors, fans, motors/engines, transformers, flues, piping and turbines.

3.3 Technological Aspects

3.3.1 Cleaner technologies

3.3.1.1 Clean coal technologies

Clean Coal Technologies (CCTs) offer the potential for major improvements in efficiency and significant reduction in the environmental emissions when used for power generation. These technologies may be utilized in new as well as existing plants and are therefore, an effective way of reducing emissions in the coal fired generating units. Several of these systems are not only very effective in reducing SO_x and NO_x emissions, but because of their higher efficiencies they also emit lower amount of CO₂ per unit of power produced. CCTs can be used to reduce dependence on foreign oil and to make use of a wide variety of coal available.

To meet increasing demand of power with minimal environmental impact for sustainable development, adoption of clean coal technologies with enhanced power plant efficiency, fuel switching, use of washed coal, efficient pollution control systems and proper by-product and waste handling & utilization, is necessary.

Pre-Combustion Technologies

Coal Beneficiation: Ash sulphur and other impurities can be reduced from the coal before it is burnt.

Combustion Technologies

Generation of emissions of SO₂, NO_x & CO₂ can be minimized by adopting improved combustion technologies

Super-critical Technology: By increasing steam temperature and pressure, the efficiency of the steam turbine (and hence, of electricity generation) can be increased. As the steam-pressure and temperature increases to a critical point, the characteristics of steam are altered such that water and steam are no longer distinguishable and it is known as super-critical steam and this technology is more efficient.

Fluidized Bed Combustion Technologies (CBFC, AFBC & PFBC)

Integrated coal gasification combined cycle (IGCC)

As per recommendation of an advisory sub-group for coal power technology (set up in 1989) Indian utilities should have moved to 750 MW size units with the choice of sub-critical/super-critical parameters being left to utilities (CEA, 2003). However, no units larger than the 500 MW were installed in this period and the 500 MW units were all based on sub-critical steam, despite the CEA's and the Planning Commission's calls for super-critical PC technology deployment by the late 1990s.

Use of pure oxygen (oxyfuel combustion) instead of air is also being considered for addressing GHG requirements. Table 3-11 highlights the comparison of different technology options in the Indian context.

At this point of time India is venturing in different technology options. IGCC technologies well proven is perhaps a technology of choice in medium to long-term prospective, they rate high on efficiency and environmental attributes, but still require more maturity time in the Indian context. Based on overall considerations of the technologies, super-critical PC and CFBC could be considered best in the present circumstances: super-critical PC because of its efficiency, maturity, and relatively low cost and CFBC because of its fuel flexibility and reduction in SO_x and NO_x emissions. Although sub-critical PC has tremendous experience in India but perform poorly on efficiency and environmental account. However, this analysis only a broad view point towards better technology assessments for India that incorporates key challenges and constraints in the Indian coal power sector. As per CEA the choice of a technology is governed by one or more of the following considerations:-

- Higher energy conversion efficiency resulting in less fuel consumption and consequently low level of pollutant emission.
- Reduced environmental degradation through use of pollution abatement technologies.
- Higher plant availability
- Better overall economics

The maturity and appropriateness of the technology, its availability at competitive cost and reliable support during project life are also the consideration. Adoption of 800 MW units with super-critical technology has been taken as major initiative in this regard.

At present, the largest thermal unit size in operation is 500 MW with sub-critical steam parameters. Few 660 MW units with super-critical parameters are under construction. Based on study carried out by CEA, it was recommended to have 800-1000 MW units in the country using super-critical parameters with higher temperatures of 568/593 °C for Superheat /Reheat steam. Higher size coal based units of 800-1000 MW, which are environment friendly with super critical technology, are proposed to be introduced to achieve the huge capacity addition programme. Also, in view of difficulties faced by power utilities in getting coal allocation, now thrust is being given to identify and set up power plants in the coastal regions using imported/washed coal.

Post-combustion Technologies

End of pipe treatment: Installation of pollution control equipments such as ESP, DENOX & De SO_x systems)

Table 3-11: Comparison of Clean Power Technologies

Technology	Sub-critical PC	Super-critical PC (SC-PC)	Advanced/Ultra Super-critical PC (USC-PC)	Circulating FBC (CFBC)	Oxyfuel PC/CFBC	IGCC - Entrained-flow	IGCC - Fluidized-bed
Use in India:	Almost all Indian TPS	Sipat-I TPS (in construction); Barh TPS (order placed)		Surat Lignite TPS, Akrimota Lignite PS		Might be useful for using refinery residues	R&D, Pilot scale plant. Plans for demonstration plant.
Worldwide:	Standard technology worldwide	Europe (Denmark, Netherlands, Germany); Japan, U.S., China, Canada	Netherlands, Denmark, Japan	U.S., Europe, Japan, China, Canada	Development and planned pilot plants in Europe, Australia, Canada. Useful mainly for CCS	Demonstration/Commercial plants in U.S., Europe, Japan, China	A6 MW Unit in Europe, 100 MW demo plant in U.S., biomass IGCC in Brazil Widespread use for chemical production and poly generation
Level of Maturity	Commercial	Commercial	Commercial/Demonstration	Commercial	R&D/Pilot Scale	Gasifier - Commercial; IGCC - Commercially proven	Gasifier - Commercial; IGCC - demonstration
Output flexibility	Electricity; steam and Heat are also possible	Electricity; steam and heat are also possible	Electricity; steam and heat are also possible	Electricity; steam and heat are also possible	Electricity; steam and heat are also possible	Electricity; syn-ga, chemicals, FT liquids. H ₂ , steam, heat	Electricity; syn-ga, chemicals, FT liquids. H ₂ , steam, heat

Technology	Sub-critical PC	Super-critical PC (SC-PC)	Advanced/Ultra Super-critical PC (USC-PC)	Circulating FBC (CFBC)	Oxyfuel PC/CFBC	IGCC - Entrained-flow	IGCC - Fluidized-bed
Fuel Flexibility	Can be flexible, with loss in efficiency	Can be flexible, with loss in efficiency	Can be flexible, with loss in efficiency	Highly flexible, use of high ash coals supported	Same as PC and CFBC	Very flexible, but limited to low ash-content and ash fusion temp. coals	Very flexible, but limited to high ash fusion temp. coals limited use of oils.
Net Efficiency (net HHV) India:	31-34%; 33%	35%		30-33%			40%
Worldwide:	36-39% (w/o FGD)	39-41%	40-44%	34-40%	34% (USC-PC)	35-40%	44-48%
	37-38% (w/o FGD)				25% (CFB-subcritical)		
Capital Cost (TPC: S/kW) India	610 (w/o FGD) 750 (w/o FGD)			770			1290
Worldwide:	930-1090 (w/o FGD) 1080-1280 (w/FGD)	1090-1290	960-1340	1070-1340	1410; 2370-2410 (w/CCS)	1200-1610	1250-1270

Note:

CFBC – Circulating Fluidized-Bed Combustion

PFBC – Pressurized Fluidized-Bed Combustion

IGCC – Integrated Coal Gasification Combined Cycle

3.3.2 Pollution control technologies

Air pollutants emitted from combustion process from boilers consists mainly of particulates, sulphur oxides, nitrous oxides, heavy metals, and CO₂ – chemicals that cause serious health and environmental damages. There are a range of flue gas treatment technologies for reducing such flue gas emissions of these pollutants, they are now typically a part of specific coal-utilization technology packages. The add-on pollution-reducing technologies are broadly installed at three stages namely: pre-combustion, in-combustion and post-combustion. In pre-combustion stage coal beneficiation/washing is carried out to reduce the overall amount of coal ash and also increase energy efficiency. The pollution cleanup technologies in an IGCC plant to remove particulates and sulphur from the combustion gas are also viewed as pre-combustion mechanisms. During in-combustion stage, low NO_x to reduce NO_x emissions, dry limestone scrubbing for sulphur removal in fluidized-bed combustion and gasification are incorporated as pollution control measures. In India, currently only particulate matter is being controlled using electrostatic precipitator or bag filters as post-combustion pollution control.

Table 3-12: List of Pollution Control Technologies

Cleanup Technology	Stage w.r.t Combustion	Emissions Cleaned
Coal Washing/beneficiation	Pre-combustion	Fly ash Sulphur Mercury CO ₂ ³⁷¹
Electrostatic Precipitator (ESP)	Post-combustion	Fly ash
Bag filter	Post-combustion	Fly ash
Cyclone	Post-combustion	Fly ash Mercury
Sulphur removal plant	Pre-combustion	Sulphur
Limestone	In-combustion	Sulphur
Flue gas desulphurization (FGD)	Post-combustion	Sulphur
Low NO _x burners	In-combustion	NO _x
Selective Catalytic Reducers	Post-combustion	NO _x
CO ₂ Shift reactor	Pre-combustion	CO ₂
Amine scrubbing	Post-combustion	CO ₂

Clean Technology Comparison

Often TPP technologies have been compared with respect to cost of generation alone but this is not adequate in the current situation. In order to provide a common basis for comparisons, all of the technologies are assumed to be used in power plants built in Northern India, using hard Indian coal as feedstock. In one comprehensive study different technologies were compared with respect to the attributes (listed below) which are not completely independent of each other; for example, as a technology develops, its costs become less through economies of scale, and high-efficiency technologies will have better environmental performance.

The earlier mentioned technologies (earlier in the chapter) were scored on the following attributes that are important for meeting the challenges and constraints for the Indian energy sector:

- Ability to use domestic coal
- Maturity of Technology
- Indigenous technical capacity
- Low Capital Cost
- Efficiency
- Low environmental impact.
- Carbon capture potential

The technologies were rated under current status and performance, as well as in a future scenario (assumed to be about 10 years from now) on a scale of 1 to 10, wherein some assumptions about the trajectory of technology development were also made.

This study/analysis under the mid-term future scenario reflected that the current PC and CFBC technologies using subcritical steam conditions and the advanced-PFBC technology are not suitable for meeting the future Indian challenge of high efficiency and carbon mitigation. The best technologies for India in the mid-term future, which got the highest rating seem to be CFBC technologies, supercritical PC and ultra-supercritical PC. IGCC fluidized-bed and moving-bed technologies also ranked high, but were lower than the more efficient combustion technologies. In addition, oxyfuel and IGCC entrained-flow technologies will become the important options as they are capable of meeting effectively the carbon capture challenge. As in the present scenario, even the sensitivity analysis did not significantly altered this assessments.

However, this analysis should not be considered as ultimate as it can be further refined on various accounts. This analysis is among the various other analysis as an assessment tool for a way forward. For example, the performance of technologies on various attributes can be rated by a number of different experts and stakeholders based on detailed performance data base and actual field surveys.

One study on EU power scenario reflected that that in the next decades the overall condition is such that research and development for fossil technologies will progress steadily and deployment of improved and advanced fossil technologies will continue in the EU as well as worldwide.

The study proved that since IGCC power plants still are in their early stage of development, supercritical steam power plants will probably be the preferred coal-based power generation technology for installation of new capacity in the short-term, with a development towards more advanced steam conditions. Due to their relative flexibility concerning fuel type and their good environmental performance, IGCC power plants can also efficiently use fuel feedstock such as biomass and refinery residual. Moreover, IGCC systems could be part of a particularly clean power plant system, integrated with advanced gas turbines and fuel cells. There are some main challenges for sound environmental performance in the electricity generation from coal as per EU studies are:

- Increase of the thermal efficiency in order to reduce CO₂ and other emissions per unit of net electricity supplied to the network. The average efficiency of current

technologies has been steadily increasing, but there is still potential for further improvements.

- Mitigation or nearly elimination of emissions such as nitrogen oxides, sulphur oxides and particulate matter. This has largely been achieved and costs are decreasing, but this implementation has to be applied to as many units as possible and extended to as many countries as possible, depending on national standards.
- Mitigation or nearly elimination of CO₂ emissions. The development of so-called ‘zero emissions technologies’ has been tackled and progressed.

3.4 Risk Potential & Quantitative Risk Assessment

A hazard is a danger, peril, source of harm, or an adverse impact on people or property. Risk is an expression of chance, a function of the likelihood of an adverse impact and the magnitude of its consequences.

Environmental risk assessment is the process of evaluating the likelihood of adverse effects in, or transmitted by, the natural environment from hazards that accompany human activities. The effects from hazards may be on human health, economic welfare, quality of life, and valued ecosystem components (VECs). Under QRA the severity, or distribution of the range of magnitude of the adverse effect (damage), are evaluated.

As far as history of QRA is concerned “Technological risks” began to be specifically analyzed during World War II in military operations research and thereafter in the nuclear energy and space exploration fields. The concern was mainly with infrequent but catastrophic events. Since then, the number of severe industrial accidents that have captured headlines has increased. At the same time, environmental concerns have become a central theme in public policy discussions. Factory explosions, oil tanker spills, chemical tank car derailments, and petroleum product fires have generated a public demand for prevention and a profound concern for victims and damage to the natural environment. In 1980, the Scientific Committee on Problems of the Environment (SCOPE) of the International Congress of Scientific Unions published the landmark report “Environmental Risk Assessment” (Whyte and Burton, 1980). The World Bank, after the Bhopal, India methyl isocyanate disaster, issued guidelines and a manual to help control major hazard accidents (World Bank, 1985a, 1985b). Another important development is OECD compilation of a report on risk assessment in the OECD countries with sections on the nuclear industry, chemicals, petroleum processing, transportation of hazardous materials, and dam-reservoir projects (Hubert, 1987).

Some of the major hazards associated with Thermal Power Projects are with flammable or explosive material, extreme conditions of temperature or pressure, large mechanical equipment.

3.4.1 Performing QRA

QRA process involves four questions:

- What can go wrong to cause adverse consequences?
- What is the probability of frequency of occurrence of adverse consequences?
- What is the range and distribution of the severity of adverse consequences?
- What can be done, at what cost, to manage and reduce unacceptable risks and damage?

Typically EIA should answer the first question, and give at least a qualitative expression of the magnitude of the impacts. The major additional consideration in QRA is the frequency of occurrence of adverse events. Risk management is integrated into QRA because it is the attitudes and concerns of decision makers that set the scope and depth of the study. QRA attempts to quantify the risks to human health, economic welfare, and ecosystems from those human activities and natural phenomena that perturb the natural environment. Therefore, the five step sequence in performing QRA is:

1. Hazard identification - sources of adverse impacts;
2. Hazard accounting - scoping, setting the boundaries of the ERA;
3. Scenarios of exposure - how the hazard might be encountered;
4. Risk characterisation - likelihood and severity of impact damage; and
5. Risk management - mitigation or reduction of unacceptable risk.

3.4.2 Hazard identification

Identification of hazards in QRA is of primary significance in the analysis, quantification and cost-effective control of accidents involving chemicals and process. A classical definition of hazard states that hazard is in fact the characteristic of system/plant/process that presents potential for an accident. Hence, all the components of a system/plant/process need to be thoroughly examined to assess their potential for initiating or propagating an unplanned event/sequence of events, which can be termed as an accident.

The typical methods for hazard identification employed are:

- Identification of major hazardous units based on Manufacture, Storage and Import of Hazardous Chemicals Rules, 1989 of Government of India (as amended in 2000); and
- Identification of hazardous units and segments of plants and storage units based on relative ranking technique, viz. Fire-Explosion and Toxicity Index (FE&TI).

Hazardous substances may be classified into three main classes namely Flammable substances, unstable substances and Toxic substances. Flammable substances require interaction with air for their hazard to be realised. Under certain circumstances the vapours arising from flammable substances when mixed with air may be explosive, especially in confined spaces. However, if present in sufficient quantity such clouds may explode in open air also. Unstable substances are liquids or solids, which may decompose with such violence so as to give rise to blast waves. Besides, toxic substances are dangerous and cause substantial damage to life when released into the atmosphere. The ratings for a large number of chemicals based on flammability, reactivity and toxicity have been given in NFPA Codes 49 and 345 M.

Table 3-13: Applicability of GOI Rules To Fuel/Chemical Storage for a TPP

S. No.	Chemical/ Fuel	Listed in Schedule	Threshold Quantity (T) for Application of Rules	
			5,7-9, 13-15	10-12
1	Light Diesel Oil	1 (part I)	5000 MT	50000 MT
2	Heavy Fuel Oil	1(part I)	5000 MT	50000 MT
3	Chlorine	3 (part I)	10 MT	25 MT
4	Hydrogen	1 (part II)	2 MT	50 MT
5	HSD	1 (part I)	5000 MT	50000 MT
6	Natural gas	3 (part I)	--	--

A systematic analysis of the fuels/chemicals and their quantities of storage is required, to determine threshold quantities as notified by GoI Rules, 1989 (as amended in 2000) and the applicable rules are as above.

Table 3-14: Properties of Fuels/Chemicals Used In a TPP

Chemical	Codes/Label	TLV	FBP	MP	FP	UEL	LEL
			°C			%	
Light Diesel Oil	Flammable	--	360	-	66	-	-
Heavy Fuel Oil	Flammable	--	400	338	65	7.5	0.6
Chlorine	Toxic	1 ppm	34	-	-101	-	-
Hydrogen	Reactive	--	--	--	--	-	--
HSD	Flammable	--	375	-	70	-	-
Natural Gas	Flammable	--	--	--	--	-	-

TLV: Threshold Limit Value, FBP: Final Boiling Point, MP: Melting Point, FP: Flash Point, UEL: Upper Explosive Limit, LEL: Lower Explosive Limit

TPP involve handling of various hazardous bulk chemicals (toxic and flammable), which will be used as fuel in the proposed plant. Separate storage areas are provided for these fuels and should be handled with utmost care following the safety norms for handling of hazardous chemicals. Bulk storages are required for those chemicals, which will be required in the large quantity and are flammable/toxic in nature. The storage tanks should be in the isolated zone and should have firewater hydrant system.

Where as for the Gas fuels the turbine will run on Natural Gas as the prime fuel. HSD will also be used only in case of emergency (say for maximum period of 3 days).

Heavy Fuel Oils having flash points above 55°C is not classified as flammable. Flammability limits for fuel vapour /air mixtures lie between approximately 1.0 to 6.0 % (V/V); auto-ignition temperatures are in the range of approximately 220 to 300°C. Ignition of heavy fuel oils at ambient temperature may be difficult, but if ignited at elevated temperatures, the product will burn, it is recommended that the head space of all

heavy fuel oil tanks should be considered potentially flammable and appropriate precautions taken.

3.4.3 Fire explosion and toxicity index approach

Fire, Explosion and Toxicity Indexing (FE & TI) is a rapid ranking method for identifying the degree of hazard. The application of FE & TI would help to make a quick assessment of the nature and quantification of the hazard in these areas. However, this does not provide precise information. Respective Material Factor (RMF), General Hazard Factors (GHF), Special Process Hazard Factors (SPHF) are computed using standard procedure of awarding penalties based on storage handling and reaction parameters. Before hazard indexing can be applied, the installation in question should be subdivided into logical, independent elements or units. In general, a unit can logically be characterized by the nature of the process that takes place in it. In some cases, the unit may consist of a plant element separated from the other elements by space or by protective walls. A plant element may also be an apparatus, instrument, section or system that can cause a specific hazard. For each separate plant process which contains flammable or toxic substances, a fire and explosion index (F) and/or a toxicity index (T) could be determined in a manner derived from the method for determining a fire and explosion index developed by the Dow Chemical Company.

DOW's Fire and Explosion Index (F and E) is a product of Material Factor (MF) and hazard factor (F3) while MF represents the flammability and reactivity of the substances, the hazard factor (F3), is itself a product of General Process Hazards (GPH) and special process hazards (SPH). An accurate plot plan of the plant, a process flow sheet and Fire and Explosion Index and Hazard Classification Guide published by Dow Chemical Company are required to estimate the FE & TI of any process plant or a storage unit.

The Fire and Explosion Index (F&EI) can be calculated from the following formula:

$$F\&EI = MF \times (GPH) \times (SPH)$$

The degree of hazard potential is identified based on the numerical value of F&EI as per the criteria given below:

F&EI Range	Degree of Hazard
0-60	Light
61-96	Moderate
97-127	Intermediate
128-158	Heavy
159-up	Severe

The toxicity index is primarily based on the index figures for health hazards established by the NFPA in codes NFPA 704, NFPA 49 and NFPA 345 m.

By comparing the indices F&EI and TI, the unit under QRA is classified into one of the following three categories established for the purpose.

Table 3-15: Categories of QRA

Category	Fire and Explosion Index (F&EI)	Toxicity Index (TI)
I	F&EI < 65	TI < 6
II	65 < or = F&EI < 95	6 < or = TI < 10
III	F&EI > or = 95	TI > or = 10

Certain basic minimum preventive and protective measures are required for the three hazard categories.

Fire and Explosion are also the likely hazards due to the TPP fuel storage hence, FE&TI should be estimated.

3.4.4 Hazard assessment and evaluation

A preliminary hazard analysis is carried out to identify the major hazards associated with storages in the plant. This is followed by consequence analysis to quantify these hazards. Finally, the vulnerable zones are plotted for which risk reducing measures are deduced and implemented.

Physical and Health Occupational Hazards in any large scale Chemical /Hydrocarbon Processing Industry (CPI/HPI) can be broadly classified into the following categories:

- Mechanical Risks
- Electrical Risks
- Fire/Explosion Risks
- High /low Temperature Exposure Risks
- Toxic/Carcinogenic Chemicals Exposure Risks
- Corrosive/Reactive/Radioactive Chemicals Exposure Risks

The first two types of risks are of universal nature associated with any industrial activity and not specific to a particular plant or process. Mechanical risks which are generally encountered are injuries to the head, Limbs, eyes, *etc.*, usually as a results of negligence on the part of operating/maintenance personnel in the use of improper tools, bypassing prescribed safety procedures neglect of personal protective wear and risks associated with rotating machinery as well as risks associated with high-energy release from compressed gases. Electrical risks which result in shock and/or burns are most often a consequence of poor maintenance, ingress of dust or moisture, handling by unauthorized personnel and use of improper/substandard hardware.

3.4.5 Failure mode analysis: fault tree analysis

During hazard analysis the sequence of events which could lead to hazardous incidents is set out. The likelihood of the incident is then quantified. Fault tree analysis plays a key role in this part of the risk assessment. Fault tree analysis is normally used to evaluate failures in engineering systems. The analysis provides a graphical representation of the relationships between specific events and the ultimate undesired event (sometimes referred to as the “top event”). For example, the ultimate undesired event might be a large fire for which the preceding events might be both spilling a large quantity of flammable liquid and introducing a source of ignition.

Fault tree analysis allows systematic examination of various materials, personnel, and environmental factors influencing the rate of system failure. The method also allows for the recognition of combinations of failures, which may not otherwise be easily discovered. The fault tree analysis is sufficiently general to allow both qualitative and quantitative estimates of failure probabilities within the analysis

There are various modes in which flammable and toxic chemicals can leak into atmosphere causing adverse affects. It may be small leaks from gaskets of the flanged joints, or guillotine failure of a pipeline or even catastrophic failure of the storage tank. Some typical modes of failures and their possible causes are discussed below:

Table 3-16: Failure Mode Analysis

S. No.	Failure Mode	Probable Cause	Remarks
1.	Flange / Gasket failure	Incorrect gasket Incorrect installation.	Attention to be paid during selection and installation of gaskets.
2	Weld failure	It is normally due to poor quality of welds	Welding to be done by certified welders with right quality of welding rods. Inspection and radiography must also be done.
3	Pipe corrosion erosion or failure due to stress	Some times fabrication or installation leaves stress in the pipes. Erosion or corrosion also is sometimes the cause.	Pipes material of construction should be selected correctly. Design should take care of erosion effects. And installation of pipes should not leave any stress.
4	Over pressurization of pipeline	Over pressurization can occur due to failure of SRV or incorrect operation.	Necessary procedures should be there to prevent.
5	Deficient installation of pipes	Pipes design and installation is sometimes not as per appropriate standard.	It must be ensured that installation is as per correct standards completely.
6	Leaks from valve	Leaks from glands, bonnets or failures valves spindle is sometimes the cause.	Right selection of valves and their maintenance should be ensured.
7	Instruments failure	Multifarious instruments are used for control of process parameters. Any such instrument failure can cause mishap.	Reliability of instruments working must be ensured through proper selection and maintenance.
8	Failures of protective system	Protective system like SRV, bursting discs, vent header, drain lines <i>etc.</i> are provided to take care of abnormal conditions.	Reliability of protective system must be ensured highest through inspection and proper maintenance.
9	Operational effort	Plant operational parameters should not be exceeded beyond the permissible limits.	Operating procedures must be complete and strictly followed.

S. No.	Failure Mode	Probable Cause	Remarks
10	Other failures	There are external other reasons causing the failures.	Design and operating philosophy must consider all possible reasons.

Example of Development of Fault Tree Logic in Gas-Based TP

An initial step in fault tree analysis is to organise the fault tree study according to the particular risk assessment being carried out. For a particular hazardous event, it is important that the analysis be broad enough to include all identifiable initiating events yet it must also retain a balanced depth. Initiating events fall into three broad categories — operator error, equipment failure, and external events. Generally, the analysis of operator error and equipment failure receives thorough attention and can be considered one of the more reliable stages in risk assessment.

Event and fault trees are approaches to schematically breaking down complex systems into manageable parts for which failure rates or other risk-related data can be found. It is thus possible to construct some idea of the failure rate and resultant risk of a large, complex, and new entity, such as a chemical plant, even if no data about its performance exist.

A typical fault tree is given in Figure 3-6 is an example of a fault tree applied to leakage from a gas pipe line valve in a gas fired power plant

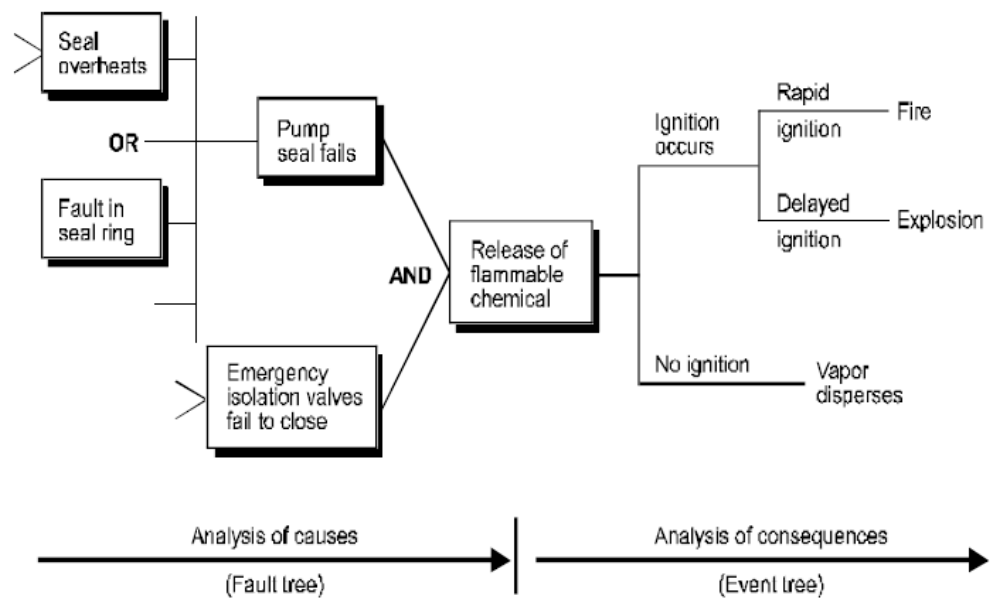

Figure 3-6: Fault Tree (event) Building for a Gas Based Thermal Power Plant

3.4.6 Preliminary hazard analysis

The purpose of the preliminary hazards analysis (PHA) is to identify early in the design process the potential hazards associated with, or inherent in a process design, thus eliminating cost and time consuming delays caused by design changes made later. This also eliminates potential hazard points at design stage itself.

An assessment of the conceptual design is conducted for the purpose of identifying and examining hazards related to feedstock materials, major process components, utility and support systems, environmental factors, proposed operations, facilities, and safeguards.

In the proposed plant major hazard is fire due to the storage of chemicals in the tanks. The process related hazards are very rare as the process is carried out in closed reaction vessels and does not involve exothermic reactions. Other hazardous installation is the boiler where the steam is generated and used in the process at various stages.

3.4.6.1 Electrical hazards

Electrical hazards leading to fire and explosion in switchgear and other equipment mainly due to failure of circuit breakers, insulators, fuses, busbars, and poor maintenance. Accidents may also occur in transformer due to open arcing, flashover above oil level, insulator failure, overloading, failure of air cooling system, lighting *etc.* Nevertheless, all these hazards lead to localized accidents only.

3.4.6.2 Fire hazards

There could be other areas in the plant that have a potential for fire hazard and require adequate firefighting equipment for example, the raw material storages. These are considered here since uncontrolled fire may trigger the above emergencies due to domino effect. However for the proposed plant, safety guidelines will be as per Tariff Advisory Committee.

3.4.6.3 Cable galleries (DG room)

For containment of fire and preventing it from spreading in the cable galleries, unit wise fire barriers with self-closing fire resistant doors are planned. The ventilation system provided in the cable galleries will be interlocked with the fire alarm system so that, in the event of a fire alarm, the ventilation system is automatically switched off. Also to avoid spreading of fire, all cable entries/openings in cable galleries, tunnels, channels, floors, barriers *etc.*, will be sealed with non-inflammable/fire resistant sealing material.

3.4.6.4 Toxic release

The proposed plant will use chlorine, which is toxic. If not handled properly, will lead to toxicity. Self-contained breathing apparatus will be available in the plant premises in the event of leakage in case of emergency. Employees will be trained in handling these self-contained breathing apparatus. Since the quantity of toxic release will be on lower side, off site implications of release are not envisaged.

Table 3-17: Preliminary Hazard Analysis for Process/Storage Areas

Equipment	Process/Storage	Potential Hazard	Provision
Turbine	Converts pressure in the flue gas into mechanical energy.	Mechanical and fire hazards.	Layout of equipment/machinery is done in accordance to plant and electrical inspectorate.

Thermal Power Plant Industry

Equipment	Process/Storage	Potential Hazard	Provision
Generator	Converts mechanical energy into electrical energy.	Mechanical hazards and fire hazards in Lube oil system Cable galleries Short circuits	As above
Power Transformers	-	Fire and explosion	All electrical fittings and cables are provided as per the specified standards. Ensure that all electrical cabling in the area are properly insulated and covered. Foam / CO ₂ / dry powder type fire extinguishers are to be provided.
Switch Yard	Switch Yard	Fire	As above
Switch Yard control room	-	Fire in cable galleries and switch	As above
Boilers	-	Fire (mainly near burners), steam; Explosion	As above
DG set		Fires in Cable galleries, Short circuits in Control Rooms and Switch-gears	As above
Natural Gas pipeline		Fire and Explosion	Frequent monitoring of valves and joints. Sprinkling system shall be provided. Ensure that all electrical cabling in the area are properly insulated and covered. Foam / CO ₂ / dry powder type fire extinguishers are to be provided. Pipeline design as per OISD norms.
Chlorine	Used for water treatment in different phases in cooling water, potable water and raw water.	Toxic accidental release	Leak detection and neutralization system will be provided.
HFO storage (Heavy Fuel)		Combustion at elevated temperature	Leak detection and neutralization system will be provided.
LDO Storage		Fire	
Hydrogen Plant		Explosion	
HSD		Fire	

Table 3-18: Preliminary Hazard Analysis for the Whole Plant in General

PHA Category	Description of Plausible Hazard	Provision
Environmental factors	If there is any leakage and eventuality of source of ignition.	All electrical fittings and cables are provided as per the specified standards. All motor starters are flame proof.
	Highly inflammable nature of the chemicals may cause fire hazard in the plant	A well designed fire protection including protein foam, dry powder, CO ₂ extinguisher should be provided. Fire extinguisher of small size and big size are provided at all potential fire hazard places. In addition to the above, fire hydrant network is also provided to complete plant.

3.4.7 Safety measures

3.4.7.1 Maximum credible accident (MCA) analysis

Hazardous substances may be released as a result of failures or catastrophes, causing possible damage to the surrounding area. This section deals with the question of how the consequences of the release of such substances and the damage to the surrounding area can be determined. MCA analysis encompasses certain techniques to identify the hazards and calculate the consequent effects in terms of damage distances of heat radiation, toxic releases, vapour cloud explosion, *etc.* A host of probable or potential accidents of the major units in the complex arising due to use, storage and handling of the hazardous materials are examined to establish their credibility. Depending upon the effective hazardous attributes and their impact on the event, the maximum effect on the surrounding environment and the respective damage caused can be assessed.

Consequence analysis is basically a study of quantitative analysis of hazards due to various failure scenarios. It is that part of risk analysis, which considers failure cases and the damage caused by these failure cases. It is done in order to form an opinion on potentially serious hazardous outcome of accidents and their possible consequences. The reason and purpose of consequence analysis are many folds like:

- Part of Risk Assessment
- Plant Layout/Code Requirements
- Protection of other plants
- Protection of the public
- Emergency Planning
- Design Criteria (*e.g.* Loading on Control Room)

The results of consequence analysis are useful for getting information about all known and unknown effects that are of importance when some failure scenario occurs in the plant and also to get information as how to deal with the possible catastrophic events. It also gives the workers in the plant and people living in the vicinity of the plant, an understanding of their personal situation.

3.4.8 Damage criteria

The storage and unloading at the storage facility may lead to fire and explosion hazards. The damage criteria due to an accidental release of any hydrocarbon arise from fire and explosion.

Tank fire would occur if the radiation intensity is high on the peripheral surface of the tank leading to increase in internal tank pressure. Pool fire would occur when the flammable liquid in the tank due to leakage gets ignited.

3.4.8.1 Fire damage

A flammable liquid in a pool will burn with a large turbulent diffusion flame. This releases heat based on the heat of combustion and the burning rate of the liquid. A part of the heat is radiated while the rest is converted away by rising hot air and combustion products. The radiations can heat the contents of a nearby storage or process unit to above its ignition temperature and thus result in a spread of fire.

The radiations can also cause severe burns or fatalities of workers or firefighters located within a certain distance. Hence, it will be important to know beforehand the damage potential of a flammable liquid pool likely to be created due to leakage or catastrophic failure of a storage or process vessel. This will help to decide the location of other storage/process vessels, decide the type of protective clothing the workers/firefighters need, the duration of time for which they can be in the zone, the fire extinguishing measures needed and the protection methods needed for the nearby storage/process vessels.

Table 3-19 tabulates the damage effect on equipment and people due to thermal radiation intensity whereas; the effect of incident radiation intensity and exposure time on lethality is given in Table 3-20.

Table 3-19: Damage Due to Incident Radiation Intensities

Sl. No.	Incident Radiation (kW/m ²)	Type of Damage Intensity	
		Damage to Equipment	Damage to People
1	37.5	Damage to process equipment	100% lethality in 1 min. 1% lethality in 10 sec.
2	25.0	Minimum energy required to ignite wood at indefinitely long exposure without a flame	50% Lethality in 1 min. Significant injury in 10 sec.
3	19.0	Maximum thermal radiation intensity allowed on thermally unprotected adjoining equipment	--
4	12.5	Minimum energy to ignite with a flame; melts plastic tubing	1% lethality in 1 min.
5	4.5	--	Causes pain if duration is longer than 20 sec, however blistering is un-likely (First degree burns)

Sl. No.	Incident Radiation (kW/m ²)	Type of Damage Intensity	
		Damage to Equipment	Damage to People
6	1.6	--	Causes no discomfort on long exposures

Source: Techniques for Assessing Industrial Hazards by World Bank.

Table 3-20: Radiation Exposure and Lethality

Radiation Intensity (kW/m ²)	Exposure Time (seconds)	Lethality (%)	Degree of Burns
1.6	--	0	No Discomfort even after long exposure
4.5	20	0	1 st
4.5	50	0	1 st
8.0	20	0	1 st
8.0	50	<1	3 rd
8.0	60	<1	3 rd
12.0	20	<1	2 nd
12.0	50	8	3 rd
12.5	--	1	--
25.0	--	50	--
37.5	--	100	--

3.4.8.2 Damage due to explosion

Explosion is a sudden and violent release of energy accompanied by the generation of pressure wave and a loud noise. The rate of energy release is very large and has potential to cause injury to the people, damage the plant and nearby property *etc.* The effect of over-pressure can directly result in deaths of those working in the immediate vicinity of the explosion. The pressure wave may be caused by a BLEVE (Boiling Liquid Expanding Vapour Cloud) or Vapour Cloud explosion.

3.4.8.3 BLEVE - fireball

BLEVE is sometimes referred to as a fireball. A BLEVE is a combination of fire and explosion with an intense radiant heat emission within a relatively short time interval. This phenomenon can occur as a result of overheating of a pressurized vessel by a primary fire. If a pressure vessel fails as a result of a weakening of its structure the contents are instantaneously released from the vessel as a turbulent mixture of liquid and gas expanding rapidly and dispersing in air as a cloud. When this cloud is ignited a fireball occurs causing enormous heat radiation intensity within a few seconds. This heat intensity is sufficient to cause severe skin burns and deaths at several hundred meters from the vessel, depending on the quantity of gas involved. A BLEVE can therefore be caused by a physical impact on a vessel or a tank, which is already overstressed.

3.4.8.4 Vapour cloud explosion

Explosion can be confined and unconfined vapour cloud explosions. Confined explosions are those, which occur within some sort of containment such as a vessel or pipeline. Explosions in buildings also come under this category. Explosions which occur in the open air are referred to as unconfined explosions and produce peak pressures of only a few kPa. The peak pressures of confined explosions are generally higher and may reach hundreds of kPa. Table 3-21 tabulates the damage criteria as a result of peak over pressure of a pressure wave on structures and people.

Table 3-21: Damage Due To Peak over Pressure

Human Injury		Structural Damage	
Peak Over Pressure (bar)	Type of Damage	Peak Over Pressure (bar)	Type of Damage
5 - 8	100% lethality	0.3	Heavy (90% damage)
3.5 - 5	50% lethality	0.1	Repairable (10% damage)
2 - 3	Threshold lethality	0.03	Damage of Glass
1.33 - 2	Severe lung damage	0.01	Crack of Windows
1 - 1 ^{1/3}	50% Eardrum rupture	-	-

Source: Marshall, V.C. (1977) 'How lethal are explosives and toxic escapes'.

3.4.8.5 Effect due to toxic gas release

Chlorine is a greenish-yellow, highly reactive halogen gas that has a pungent, suffocating odour. The vapour is heavier than air and will form a cloud in the vicinity of a spill. Like other halogens, chlorine exists in the diatomic state in nature. Chlorine is extremely reactive and rapidly combines with both inorganic and organic substances. Chlorine is an eye and respiratory tract irritant and, at high doses, has direct toxic effects on the lungs. The critical values of chlorine concentrations in air are given in Table 3-22.

Table 3-22: Critical Concentrations for Chlorine

Criteria	Concentration
90% lethality (10 min exposure)	866 ppm
50% lethality (10 min exposure)	433 ppm
10% lethality (10 min exposure)	217 ppm
Immediate Damage to life and Health (IDLH)	25 ppm

3.4.8.6 Typical scenarios considered in TPP for MCA analysis

Based on the storage and properties of the chemicals at the TPP, the some typical scenarios relevant for MCA analysis is given in the following Table.

Table 3-23: Scenarios Considered For MCA Analysis

Sl. No.	Fuel/Chemical	Quantity	Pool Fire	Explosion	Toxic Release	Jet Fire
1	Failure of LDO storage tanks		*	-	-	--
2	Catastrophic Failure of LDO + HFO Storage Tanks		*	-	-	--
3	Failure of Chlorine cylinder		-	-	*	--
4	Failure of Hydrogen cylinder at Filling Station		-	*	-	--
5	Catastrophic Failure of all HSD Storage Tanks		*	-	-	--
6	Catastrophic Failure of Natural Gas Pipeline connected to turbine		-	-	-	*

Note:

* Considered for MCA Analysis

Most likely scenario is leakage of Chlorine and forming toxic cloud during unloading operation and leakage of Hydrogen leading to explosion during filling operation.

A perusal of the above table indicates that major material storage is flammable liquid. Fires could occur due to presence of ignition source at or near the source of leak or could occur due to flashback upon ignition of the traveling vapour cloud. Tank fires may occur due to the following:

- Ignition if rim seal leak leading to rim seal fire and escalating to full-fledged tank fire. Lighting is a major source of ignition of tank fires; and
- Overflow from tank leading to spillage and its subsequent ignition, which flashes back to the tank leading to tank fire. The chance of overflow should be less unless operator has grossly erred. Spillage due to overflow may result in a dyke fire if ignition occurs after sufficiently long period.
- For radiation calculations, pool fire may be important and the criteria of 4.5 kW/m² could be selected to judge acceptability of the scenarios. The assumptions for calculations are:
 - It is not continuous exposure
 - It is assumed that no fire detection and mitigation measures are initiated

- There is not enough time available for warning the public and initiating emergency action
- Secondary fire at public road and building is not likely to happen
- The effect of smoke on reduction of source radiation intensity has not been considered; therefore hazard distances calculated tend to be conservative; and
- Shielding effect of intervening trees or other structures has not been considered. No lethality is expected from this level of intensity although burn injury takes place depending on time of exposure

3.4.9 Consequence analysis

3.4.9.1 Effect of thermal radiation on population

TLV of 1.6 kW/m² can be adopted as the safe radiation intensity for human population even for long exposures to calculate safe zone.

Domino Effect

The term domino effect denotes a chain of accidents, or situations, in which a fire/explosion load generated by an accident in one unit in an industry causes secondary and higher order accidents in other units. Such chains of accidents have a greater propensity to cause damage than stand-alone accidents. Most of the past risk assessment studies deal with accident only in a single industry, more so in one of the units of an industry. However, often, accident in one unit causes a secondary accident in a nearby unit, which in turn may trigger a tertiary accident, and so on. The probability of occurrence and adverse impacts of such ‘domino’ or ‘cascading’ effects will be more prominent for industrial estates.

3.4.10 Risk management

The communication of QRA results should take the form of decision analysis; that is, what options are available, and for each option what are the risks, costs, and benefits, and how are these distributed within society. Proper comparison and communication can actually change laypeople’s misperceptions of risks, so participatory decision making may proceed on a more rational, less emotional basis. Risk management is the use of QRA results to mitigate or eliminate unacceptable risks. It is the search for alternative risk reduction actions and the implementation of those that appear to be most cost-effective. Most human activities are undertaken for obvious and direct benefits and risks are intuitively compared with these benefits. Avoiding one risk may create another (risk transference); net risk is a consideration facilitated by QRA. There are strong reiteration and feedback between risk management and hazard accounting because

- a) changes in the scope of the ERA may be necessary to fully answer the questions of management, and
- b) relatively simple changes in the project may alter the hazard and reduce risk (for example, different siting).

3.5 Summary of Applicable National Regulations

3.5.1 General description of major statutes

A comprehensive list of all the legal instruments applicable to TPPs is annexed as **Annexure II**.

3.5.2 General standards for discharge of environmental pollutants

List of general standards for discharge of environmental pollutants as per CPCB is given in **Annexure III**.

3.5.3 Industry-specific requirements

There are well-defined regulatory requirements which imply that the government must regulate various aspects of the TPP operations and construction to reduce their environmental and social impacts.

The CPCB has noted that many TPPs default on meeting pollution standards. As Table 3-24 shows, about 30% of TPPs continue to fail to meet the expected standards for emissions and about 20% fail to meet effluent standards.

Table 3-24: Compliance of Standards for Coal-based TPPs

Year	Total Number of Operating Plants	Emission Standard		Effluent Standard	
		Comply	Not Comply	Comply	Not Comply
1999-2000	74	34	40		
2000-01	76	48	28		
2001-02	78	42	36	49	29
2002-03	79	48	31	52	27
2003-04	78	56	22	63	15
2004-05	78	55	23	63	15
2005-06	78	56	22	63	15
2006-07	78	56	22	63	15

Source: CPCB Annual Report, Various Years

Environmental Standards

In order to regulate the discharge of effluent and emission from TPPs, the following standards are notified under Environment (Protection) Act, 1986. Corresponding standards are annexed as **Annexure IV**.

- Effluent and emission standards
- Stack height/ limit
- The temperature limit for discharge of condenser cooling water

Dumping and Disposal / Utilization of Fly Ash

In a bid to prevent the dumping and disposal of fly ash discharged from coal/lignite based TPPs, the MoEF has specified the following measures to regulate the use of fly ash. The Notification, No. S.O.763(E), dated the 14th September, 1999 and subsequent amendments are annexed as **Annexure V**.

At the time of clearance of thermal power projects generating fly ash, it is ensured that provisions are made for proper utilization and disposal of fly ash. Stipulations are made for 20% utilization and disposal of fly ash within one year of commissioning of the plants, with progressive 10% utilization increases for the next 7 years, reaching 100% utilization within 9 years. The project authorities are also asked to keep provision for dry ash collection system and a maximum of 100 – 350 acres land is permitted to acquire for ash disposal depending upon each case.

Recycling of fly ash by prohibiting the manufacture of clay bricks, tiles or blocks without mixing 25% of the ash with soil on weight-to-weight basis within a radius of 100 km of power plant, has been made mandatory. TPPs are also required to maintain monthly records of ash made available to each brick kiln. To ensure unhindered loading and transport of ash, there is a provision of constituting a Dispute Settlement Committee in each TPP.

Use of Beneficiated / Blended Coal

Govt. of India has promulgated a Gazette Notification (GSR 560(E) & 378(E), dated September 19, 1997 and June 30, 1998 respectively) on use of beneficiated/blended coal containing ash not more than 34 % w.e.f. June 2001 in the following power plants:

- Power plants located beyond 1000 km from pit head;
- Power plants located in critically polluted areas, urban areas and in ecologically sensitive areas.

The power plants using FBC (CFBC, PFBC & AFBC) and IGCC combustion technologies are exempted to use beneficiated coal irrespective of their locations.

3.5.4 Pending and proposed regulatory requirements

Following are the Charter on Corporate Responsibility for Environmental Protection (CREP) action points which needs to be implemented.

Action Points

- Implementation of environmental standards (both emission and effluent) in non-compliant power plants
- Tightening of emission norms for new power plants/expansion projects
- Development of SO₂ and NO_x emission standards for coal-based power plants
- Re-circulation of ash pond effluent by all TPPs except the power plants located in coastal area and using sea water for ash disposal
- Installation/activation of opacity meters with recording facility in all the units of TPPs in the country with proper calibration system

- Development of guidelines/standards for toxic metals including mercury, arsenic and fluoride emissions
- Review of stack height requirement and guidelines for power plants
- Implementation of Notification for use of beneficiated coal power plants should sign fuel supply agreement (FSA) to meet the requirement as per the matrix prepared by CEA for compliance of the Notification. Options/mechanism for setting up of coal washeries:
 - Coal India will set up its own washery
 - State Electricity Board to set up its own washery
 - Coal India to ask private entrepreneurs to set up washeries for Coal India Limited (CIL) and taking washing charges
 - State Electricity Board to select a private entrepreneur to set up a washery near pit-head Installation of coal beneficiation plant
- All the TPPs shall indicate their requirement for ash disposal in abandoned mines and Coal India Ltd./ Min. of Coal shall provide list of abandoned coalmines
- Thermal power plants to provide dry fly ash to the users outside the plant premises and uninterrupted access at the ash pond
- Power plants to provide dry fly ash free of cost to the users as per the Notification
- The amendments made by the Central Public Works Department (CPWD) in its respective schedules/ specifications for building construction, to be adhered by the State Public Works Departments (PWDs)/construction and development agencies, *etc.*
- Draft amendments in the Notification on use of up to 5% fly ash in OPC for improvement in the performance of the OPC, issued by the Bureau of Indian Standards (BIS) to be finalized and circulated to all concerned
- Fly ash mission to prepare guidelines on prioritisation of sector-wise areas for utilization of fly ash particularly in regard to value added products
- New TPPs to be considered for environmental clearance need to adopt dry ash disposal/medium (42-45%) ash concentration slurry disposal systems.
- New power plants shall also promote adoption of clean coal and clean power generation technologies.

Dumping and Disposal / Utilization of Fly Ash

The Govt. of India has proposed to issue a new Notification, in suppression of the existing Notification number S.O. 763(E) dated 14th September 1999, regarding use of fly ash in construction activities, responsibilities of TPPs and specifications for use of ash-based products/responsibility of other agencies. The draft Notification, dated 03 April, 2007 is annexed as **Annexure VI**.

Table 3-25: Country-specific Emissions from the TPPs

Country	SO ₂ Emissions [mg/m ³]	Size of the Plant	NO _x Emissions [mg/m ³]	Size of the Plant	CO ₂ Emissions [mg/m ³]	Size of the Plant	Dust Emissions [mg/m ³]	Size of the Plant
EC	400	> 500 MWt	650	> 50 MWt			50	> 500 MWt
World Bank	500 t/d or 50 µg/m ³ additional immission over slight prior SO ₂ burden (≤ 50 µg/m ³) 100 t/d or 10 µg/m ³ additional immission over high prior SO ₂ burden (>100 µg/m ³)		858 (780 for lignite)				100 (150 in rural areas and when immission <260 µg/m ³ beyond power plant perimeter)	
Australia	200		800	> 30 MWt	100		80	-
Austria	80% (sep. efficiency)	>200 MWt	800	> 50 MWt	250	> 2 MWt	50	> 50 MWt
Belgium	400	> 300 MWt	200	>100 MWt			50	> 50 MWt
Canada	740		740				125	
Denmark	860	> 50 MWt	1150	> 50 MWt			57	> 5 MWt
Finland	140	> 150 MWt	200	> 300 MWt			57	> 50 MWt
France	1700-3400	(regional)					130	> 9.3 MWt
Germany	400	> 300 MWt	200	> 300 MWt	250	> 50 MWt	50	> 5 MWt
Great Britain	90% (Sep. efficiency)	> 700 MWt	760	> 700 MWt			97	> 700 MWt
India	Height of Stack > 50 MWt : 275 m > 200 < 500 MWt : 200 m < 200 MWt : (equation)		No limits				150 (350 for plants with < 200 MWt in unprotected areas)

Thermal Power Plant Industry

Country	SO ₂ Emissions [mg/m ³]	Size of the Plant	NO _x Emissions [mg/m ³]	Size of the Plant	CO ₂ Emissions [mg/m ³]	Size of the Plant	Dust Emissions [mg/m ³]	Size of the Plant
Spain	2400						200	> 200 MWt
Sweden	290		430				35	
USA	740	> 29 MWt	740	> 29 MWt			37	> 73 MWt

The minimum size of the plant to which the relevant limit applies is stated in MWt; the volumetric flue-gas flow is stated in m³STP/h

4. OPERATIONAL ASPECTS OF EIA

Prior environmental clearance process has been revised in the Notification issued on 14th September, 2006 into following four major stages *i.e.*, screening, scoping, public consultation and appraisal. Each stage is has certain procedures to be followed. This section deals with all the procedural and technical guidance, for conducting objective-oriented EIA studies, their review and decision-making. Besides, the Notification also classifies projects into Category A, which require prior environmental clearance from MoEF and Category B from SEIAA/UTEIAA.

Consistency with other requirements

- Clearance from other regulatory bodies is not a prerequisite for obtaining the prior environmental clearance and all such clearances will be treated as parallel statutory requirements.
- Consent for Establishment (CFE) and prior environmental clearance are two different legal requirements, a project proponent should acquire. Therefore, these two activities can be initiated and proceeded with simultaneously.
- If a project falls within the purview of CRZ and EIA Notifications, then the project proponent is required to take separate clearances from the concerned Authorities.
- Rehabilitation and Resettlement (R&R) issues need not be dealt under the EIA Notification as other statutory bodies deal with these issues. However, socio-economic studies may be considered while taking environmental decisions.

4.1 Coverage of TPP Under the Purview of Notification

All the new TPP industrial projects including expansion and modernization require prior environmental clearance. Based on pollution potential, these projects are classified into Category A and Category B *i.e.*

- Category A: All TPP development projects that are
 - ≥ 500 MW (coal/lignite/naphtha and gas based); or
 - ≥ 50 MW (Pet-coke diesel and all other fuels including refinery residual oil waste except biomass);
 - > 20 MW (based on biomass or non hazardous municipal solid waste as fuel)
- Category B: All TPP developmental project that has
 - < 500 MW (coal/lignite/naphtha and gas based);
 - < 50 MW or ≥ 5 MW (Pet coke, diesel and all other fuels including refinery residual oil waste except biomass);
 - < 20 MW > 15 MW (based on biomass or non-hazardous municipal solid waste as fuel).

Besides there are general conditions, when it applies, a Category B project will be treated as Category A project. These conditions are discussed in subsequent sections.

Note:

- Power plants up to 15 MW, based on biomass and using auxiliary fuel such as coal/lignite/petroleum products up to 15% are exempt
- Power plants up to 15 MW, based on non-hazardous municipal waste and using auxiliary fuel such as coal/lignite/petroleum products up to 15% are exempt
- Power plants using waste heat boiler without any auxiliary fuel are exempt.

The sequence of steps in the process of prior environmental clearance for category A projects and the Category B projects are shown in Figure 4.1 and Figure 4.2 respectively. Each stage in the process of prior environmental clearance for the TPPs is discussed in subsequent sections. The timelines indicated against each stage are the maximum permissible time lines set in the Notification for said task. In case the said task is not cleared/objected by the concerned Authority, within the specified time, said task is deemed to be cleared, in accordance to the proposal submitted by the proponent.

In case of Expansion or Modernization of the developmental Activity:

- Any developmental activity, which has an EIA clearance (existing project), when undergoes expansion or modernization (change in process or technology) with increase in production capacity or any change in product mix beyond the list of products cleared in the issued clearance is required to submit new application for EIA clearance.
- Any developmental activity, which is listed in Schedule of the EIA Notification and due to expansion of its total capacity, if falls under the purview of either Category B or Category A, then such developmental activity requires clearance from respective authorities.

Figure 4-1: Prior Environmental Clearance Process for Activities Falling Under Category A

Figure 4-2: Prior Environmental Clearance Process for Activities Falling Under Category B

4.2 Screening

Screening of the project shall be performed at the initial stage of the project development so that proponents are aware of their obligations before deciding on the budget, project design and execution plan.

This stage is applicable only for Category ‘B’ developmental activity *i.e.*, if general conditions are applicable for a Category B project, then it will be treated as Category A project. Besides, screening is also refers to the classification of Category B projects into either Category B1 or Category B2. Category B1 projects require to follow all stages applicable for a Category A project, but are processed at the SEIAA/UTEIAA. Category B2 projects, on the other hand, do not require either EIA or public consultation.

As per the Notification, classification of Category B projects falls under the purview of the SEAC. This manual provides certain guidelines to the stakeholders for classification of Category B1 and Category B2.

4.2.1 Applicable conditions for Category B projects

General condition:

- Any TPP developmental project which is usually falling under Category B will be treated as Category A, if located in whole, or in part within 10 km from the boundary of:
 - Protected areas notified under the Wild Life (Protection) Act, 1972
 - Critically polluted areas as notified by the CPCB from time to time
 - Eco-sensitive areas as notified under section 3 of the E(P) Act, 1986, such as Mahabaleshwar Panchgani, Matheran, Panchmarhi, Dahanu, Doon valley and
 - Inter-State boundaries and international boundaries - provided that the requirement regarding distance of 10 km of the inter-state boundaries can be reduced or completely done away with by an agreement between the respective States/UTs sharing the common boundary in case the activity does not fall within 10 km of the areas mentioned above.
- If any of the conditions listed in above general condition applies, then a Category B project will be treated as Category A.
- The SEIAA shall base its decision on the recommendations of a State/UT level EAC for the purpose of environmental clearance.
- In absence of a duly constituted SEIAA or SEAC, a Category B project shall be appraised at the Central level *i.e.*, at the MoEF.
- The EAC at the State/UT level shall screen the projects or activities in Category B. SEAC shall meet at least once every month
- If any Category B TPP project/activity, after proposed expansion of capacity/production or fuel change, falls under the purview of Category A in terms of production capacity, then clearance is required from the Central Government

4.2.2 Criteria for classification of Category B1 and B2 projects

The classification of Category B projects or activities into B1 or B2 (except the project or activities listed in item 8(b) in the schedule to the EIA Notification, 2006) will be

determined based on whether or not the project or activity requires further environmental studies for preparation of an EIA for its appraisal prior to the grant of environmental clearance. The necessity of which will be decided, depending upon the nature and location specificity of the project, by SEAC after scrutiny of the applications seeking environmental clearance for Category B projects or activities.

The projects requiring an EIA report shall be included in Category B1 and remaining projects will fall under Category B2 and will not require an EIA report and public consultation.

4.2.3 Application for prior environmental clearance

- The project proponent, after identifying the site and conducting the pre-feasibility study, is required to apply for the prior environmental clearance by filling and submitting the Form 1 given in **Annexure VII**. The proponent has to submit the filled in Form 1 along with the pre-feasibility report and draft ToR for EIA studies to the concerned Authority *i.e.*, MoEF, Government of India for Category A projects and the SEIAA/UTEIAA in case of Category B projects. Please refer subsequent sections for the information on how to fill the Form 1, contents of pre-feasibility report and draft ToR for Thermal power plant.
- Prior environmental clearance is required before starting any construction work, or preparation of land on the identified site/project/activity by the project management, except for securing the land.
- If the application is made for a specific developmental activity, which has an inherent area development component as a part of its project proposal and the same project also attracts the construction and area development provisions under 8a and 8b of the Schedule, then the project will be seen as a developmental activity other than 8a and 8b of the Schedule.

4.2.4 Siting guidelines

These are the guidelines, stake holders may consider while siting the developmental projects, to minimize the associated possible environmental impacts. In some situations, adhering to these guidelines is difficult and unwarranted. Therefore these guidelines may be kept in the background, as far as possible, while taking the decisions.

Areas preferably be avoided

While siting industries, care should be taken to minimize the adverse impact of the industries on immediate neighborhood as well as distant places. Some of the natural life sustaining systems and some specific landuses are sensitive to industrial impacts because of the nature and extent of fragility. With a view to protect such sites, the industries may maintain the following distances as far as possible, from the areas listed:

- Ecologically and/or otherwise sensitive areas: Preferably 5 km; depending on the geo-climatic conditions the requisite distance may be decided appropriate by the agency.
- Coastal Areas: Preferably half-a-kilometre away from high tide line (HTL).
- Flood Plain of the Riverine System: Preferably half-a-kilometre away from flood plain or modified flood plain affected by dam in the upstream or by flood control systems.

- Transport/Communication System: Preferably half-a-kilometre away from highway and railway line.
- Major Settlements (3,00,000 population): Distance from settlements is difficult to maintain because of urban sprawl. At the time of siting of the industry, if the notified limit of any major settlement is located within 50 km, the spatial direction of growth of the settlement for at least a decade must be assessed and the industry shall be sited at least 25 km away from the projected growth boundary of the settlement.
- Critically polluted areas are identified by MoEF from time-to-time. Current list of critically polluted areas is given in **Annexure VIII**.

Note:

Ecological and/or otherwise sensitive areas include (i) Religious and Historic Places; (ii) Archaeological Monuments (e.g. identified zone around Taj Mahal); (iii) Scenic Areas; (iv) Hill Resorts; (v) Beach Resorts; (vi) Health Resorts; (vii) Coastal Areas rich in Corals, Mangroves, Breeding Grounds of Specific Species; (viii) Estuaries rich in Mangroves, Breeding grounds of Specific Species; (ix) Gulf Areas; (x) Biosphere Reserves; (xi) National Parks and Sanctuaries; (xii) Natural lakes, Swamps; (xiii) Seismic Zones; (xiv) Tribal Settlements; (xv) Areas of Scientific and Geological Interest; (xvi) Defence Installations, specially those of security importance and sensitive to pollution; (xvii) Border Areas (International) and (xviii) Air Ports.

Pre-requisite: State and Central Governments are required to identify such areas on a priority basis.

General sitting factors

In any particular selected site, the following factors must also be recognized.

- No forest land shall be used for non-forest activity for the sustenance of the industry (Ref: Forest Conversation Act, 1980).
- No prime agricultural land shall be converted into industrial site.
- Land acquired shall be sufficiently large to provide space for appropriate green cover including greenbelt, around the battery limit of the industry.
- Layout and form of the industry that may come up in the area must conform to the landscape of the area, without affecting the scenic features of that place.
- Associated township of the industry may be created at a space having physiographic barrier between the industry and the township.

Guidelines of central electricity authority [CEA], government of India, for site selection of coal-based thermal power stations

- The choice of location is based on the following:
 - Nearness to coal source;
 - Accessibility by road and rail;
 - Availability of land, water and coal for the final installation capacity;
 - Coal transportation logistics;
 - Power evacuation facilities;
 - Availability of construction material, power and water;
 - Preliminary environmental feasibility including rehabilitation and resettlement requirements, if any;

- Land requirement for large capacity power plant is about 0.2 km² per 100 MW for the main power house only excluding land for water reservoir (required if any).
- The land for housing is taken as 0.4 km² per project.
- Land requirement for ash pond is about 0.2 km² per 100 MW considering 50% of ash utilization. Land for ash pond is considered near the main plant area (say 5 to 10 km away). In case of non-availability of low lying ash pond area at one place, the possibility of having two areas in close proximity is considered.
- Water requirement is about 40 cusecs per 1000 MW.
- First priority is given to the sites those are free from forest, habitation and irrigated/agricultural land. Second priority is given to those sites that are barren, *i.e.*, wasteland, intermixed with any other land type, which amounts to 20% of the total land identified for the purpose.
- Location of thermal power station is avoided in the coal-bearing area.
- Coal transportation is preferred by dedicated marry-go-round (MGR) rail system. The availability of corridor for the MGR need to be addressed while selecting the sites.

Guidelines for site selection of coal-based thermal power stations set by the MoEF

- Locations of thermal power stations are avoided within 25 km of the outer periphery of the following:
 - metropolitan cities;
 - National park and wildlife sanctuaries;
 - Ecologically sensitive areas like tropical forest, biosphere reserve, important lake and coastal areas rich in coral formation;
- The sites should be chosen in such a way that chimneys of the power plants does not fall within the approach funnel of the runway of the nearest airport;
- Those sites should be chosen which are at least 500 m away from the flood plain of river system;
- Location of the sites are avoided in the vicinity (say 10 km) of places of archaeological, historical, cultural/religious/tourist importance and defense installations;
- Forest or prime agriculture lands are avoided for setting up of thermal power houses or ash disposal

4.3 Scoping for EIA Studies

Scoping exercise is taken up soon after the project contours are defined. The primary purpose of scoping is to identify concerns and issues which may affect the project decisions. Besides, scoping defines the requirements and boundaries of an EIA study.

Scoping refers to the process by which EAC, in case of Category ‘A’ projects or activities, and SEAC in case of Category ‘B1’ projects, including applications for expansion and/or modernization of existing projects, determines ToR for EIA studies addressing all relevant environmental concerns for preparation of an EIA Report for a particular project.

- Project proponent shall submit application to concerned Authority. The application (Form 1 as given in **Annexure VII**) shall be attached with pre-feasibility report and proposed ToR for EIA Studies. The proposed sequence to arrive at the draft ToR is discussed below:
 - Pre-feasibility report provides a precise summary of project details and also the likely environmental concerns based on secondary information, which will be availed for filling Form 1.
 - From pre-feasibility report and Form 1, valued environmental components (VECs) may be identified for a given project (receiving environment/social components, which are likely to get affected due to the project operations/activities).
 - Once the project details from pre-feasibility report & Form 1; and VECs are identified, a matrix establishing interactions which can lead to effects/impacts could be developed (Qualitative analysis).
 - For each identified possible effect in the matrix, significance analysis could be conducted to identify the impacts, which needs to be studied further (quantitative analysis) in subsequent EIA studies. All such points will find a mention in the draft ToR to be proposed by the project proponent along with the application form. The draft ToR shall include applicable baseline parameters (refer annexure XI) and impact prediction tools (refer annexure XIII) proposed to be applied.
 - The information to be provided in pre-feasibility report, guidelines for filling Form 1 and guidelines for developing draft ToR is summarized in subsequent sections.
 - Authority consults the respective EAC/SEAC to reply to the proponent. The EAC/SEAC concerned reviews the application form, pre-feasibility report and proposed draft ToR by the proponent and makes necessary additions/deletions to make it a comprehensive ToR that suits the statutory requirements for conducting the EIA studies.
- The concerned EAC/SEAC may constitute a sub-committee for a site visit, if considered necessary. The sub-committee will act up on receiving a written approval from chairperson of the concerned EAC/SEAC. Project proponent shall facilitate such site visits of the sub-committees.
- EAC/SEAC shall provide an opportunity to the project proponent for presentation and discussions on the proposed project and related issues as well as the proposed ToR for EIA Studies. If the State Government desires to present their views on any specific project, they can depute an officer for the same at the scoping stage to EAC, as an invitee but not as a member of EAC. However, non-appearance of the project proponent before EAC/SEAC at any stage will not be a ground for rejection of the application for the prior environmental clearance.
- If a new or expansion project is proposed in a problem area as identified by the CPCB, then the Ministry may invite representative SEIAA to the EAC to present their views, if any at the stage of scoping.
- The final set of ToR for EIA studies shall be conveyed to the proponent by the EAC/SEAC within sixty days of the receipt of Form 1 and pre-feasibility report. If the finalized ToR for EIA studies is not conveyed to the proponent within sixty days of the receipt of Form 1, the ToR suggested by the proponent shall be deemed as final approved for EIA studies.
- Final ToR for EIA studies shall be displayed on websites of the MoEF/SEIAA.

- Applications for prior environmental clearance may be rejected by the concerned Authority based on the recommendation of the EAC or SEAC concerned at this stage itself. In case of such rejection, the decision together with reasons for the same, shall be communicated to the proponent in writing within sixty days of the receipt of the application.
- The final EIA report and other relevant documents submitted by the applicant shall be scrutinized by the concerned Authority strictly w.r.t the approved ToR for EIA Studies.

4.3.1 Pre-feasibility report

The pre-feasibility report should include, but not limited to highlight the proposed project information, keeping in view the environmental sensitivities of the selected site, raw material, technology options and its availability. Information required in pre-feasibility report varies from case to case even in the same sector depending upon the local environmental setting within which the plant is located/proposed. However, the information which may be furnished in the pre-feasibility report may include as under:

I. Executive summary

II. Project details: Description of the project including in particular;

- a description of the main characteristics of the production processes, for instance, nature and quantity of materials used,
- an estimate, by type and quantity, of expected residues and emissions (water, air and soil pollution, noise, vibration, light, heat, radiation, *etc.*) resulting from the operation of the proposed project.
- a description of the physical characteristics of the whole project and the land-use requirements during the construction and operational phases

III. Selection of site based on least possible impacts

- An outline of the main alternatives studied by the developer and an indication of the main reasons for this choice, taking into account the environmental effects.

IV. Anticipated impacts based on project operations on receiving environment

- A description of the aspects of the environment likely to be significantly affected by the proposed project, including, in particular, population, fauna, flora, soil, water, air, climatic factors, material assets, including the architectural and archaeological heritage, landscape and the inter-relationship between the above factors.
- A description of the likely significant effects of the proposed project on the environment resulting from:
 - existence of project,
 - use of natural resources
 - emission of pollutants, creation of nuisances and elimination of waste
 - project proponent's description of the forecast methods used to assess the effects on environment.

V. Proposed broad mitigation measures which could effectively be internalized as project components to have environmental and social acceptance of the proposed site

- A description of key measures envisaged to prevent, reduce and where possible offset any significant adverse effects on the environment

VI. An indication of any difficulties (technical deficiencies or lack of know-how) encountered by the developer in compiling the required information

Details of the above listed points which may be covered in pre-feasibility report are listed in **Annexure IX**.

4.3.2 Guidance for Providing Information in Form 1

The information given in specifically designed pre-feasibility report for this developmental activity may also be availed for filling Form 1.

Form 1 is designed to help users identify the likely significant environmental effects of proposed projects right at the scoping stage. There are two stages for providing information under two columns:

- First - identifying the relevant project activities from the list given in column 2 of Form 1. Start with the checklist of questions set out below and complete Column 3 by answering:
 - Yes - if the activity is likely to occur during implementation of the project;
 - No - if it is not expected to occur;
 - May be - if it is uncertain at this stage whether it will occur or not.
- Second - Each activity for which the answer in Column 3 is “Yes” the next step is to refer to the fourth column which quantifies the volume of activity which could be judged as significant impact on the local environmental characteristics, and identify the areas that could be affected by that activity during construction /operation / decommissioning of the project. Form 1 requires information within 15 km around the project, whereas actual study area for EIA will be as prescribed by respective EAC/SEAC. Project proponent will need information about the surrounding VECs in order to complete this Form 1.

4.3.3 Identification of appropriate valued environmental components

VECs are components of natural resources and human world that are considered valuable and are likely to be affected by the project activities. Value may be attributed for economic, social, environmental, aesthetic or ethical reasons. VECs represent the investigative focal point for further EIA process. The indirect and/or cumulative effects can be concerned with indirect, additive or even synergistic effects due to other projects or activities or even induced developments on the same environmental components as would be considered direct effects. But such impacts tend to involve larger scale VECs such as within entire region, river basins or watersheds; and, broad social and economic VECs such as quality of life and the provincial economy. Once VECs are identified, then appropriate indicators are selected for impact assessments on the respective VECs.

4.3.4 Methods for identification of impacts

There are various factors which influence the approach adopted for the assessment of direct, indirect, cumulative impacts, *etc.* for a particular project. The method should be practical and suitable for the project given the data, time and financial resources available. However, the method adopted should be able to provide a meaningful conclusion from

which it would be possible to develop, where necessary, mitigation measures and monitoring. Key points to consider when choosing the method(s) include:

- nature of the impact(s),
- availability and quality of data,
- availability of resources (time, finance and staff).

The method chosen should not be complex, but should aim at presenting the results in a way that can be easily understood by the developer, decision maker and the public. A comparative analysis of major impact identification methods is given in Table 4-1.

Table 4-1: Advantages and Disadvantages of Impact Identification Methods

Methods	Description	Advantages	Disadvantages
Checklists	<ul style="list-style-type: none"> ▪ Annotate the environmental features that need to be addressed when identifying the impacts of activities in the project 	<ul style="list-style-type: none"> ▪ Simple to understand and use ▪ Good for site selection and priority setting ▪ Simple ranking and weighting 	<ul style="list-style-type: none"> ▪ Do not distinguish between direct and indirect impacts ▪ Do not link action and impact ▪ The process of incorporating values can be controversial
Matrices	<ul style="list-style-type: none"> ▪ Identify the interaction between project activities (along one axis) and environmental characteristics (along other axis) using a grid like table ▪ Entries are made in the cells which highlights impact severity in the form of symbols or numbers or descriptive comments 	<ul style="list-style-type: none"> ▪ Link action to impact ▪ Good method for displaying EIA results 	<ul style="list-style-type: none"> ▪ Difficult to distinguish direct and indirect impacts ▪ Significant potential for double-counting of impacts
Networks	<ul style="list-style-type: none"> ▪ Illustrate cause effect relationship of project activities and environmental characteristics ▪ Useful in identifying secondary impacts ▪ Useful for establishing impact hypothesis and other structured science based approaches to EIA 	<ul style="list-style-type: none"> ▪ Link action to impact ▪ Useful in simplified form for checking for second order impacts ▪ Handles direct and indirect impacts 	<ul style="list-style-type: none"> ▪ Can become very complex if used beyond simplified version
Overlays	<ul style="list-style-type: none"> ▪ Map the impacts spatially and display them pictorially ▪ Useful for comparing site and planning alternatives for routing linear developments ▪ Can address cumulative effects ▪ Information incentive 	<ul style="list-style-type: none"> ▪ Easy to understand ▪ Good to display method ▪ Good siting tool 	<ul style="list-style-type: none"> ▪ Addresses only direct impacts ▪ Does not address impact duration or probability
GIS	<ul style="list-style-type: none"> ▪ Maps the impacts spatially and displays them pictorially ▪ Useful for comparing site and planning alternatives for routing linear developments ▪ Can address cumulative effects ▪ Information incentive 	<ul style="list-style-type: none"> ▪ Easy to understand ▪ Good to display method ▪ Good siting tool ▪ Excellent for impact identification and analysis 	<ul style="list-style-type: none"> ▪ Do not address impact duration or probability ▪ Heavy reliance on knowledge and data ▪ Often complex and expensive
Expert System	<ul style="list-style-type: none"> ▪ Assist diagnosis, problem solving and decision making ▪ collects inputs from user by 	<ul style="list-style-type: none"> ▪ Excellent for impact identification and analysis 	<ul style="list-style-type: none"> ▪ Heavy reliance on knowledge and data ▪ Often complex and

Methods	Description	Advantages	Disadvantages
	answering systematically developed questions to identify impacts and determine their mitigability and significance ▪ Information intensive, high investment methods of analysis	▪ Good for 'experimenting'	expensive

The project team made an attempt to construct an impact matrix considering major project activities (generic operations) and stage-specific likely impacts which is given in Table 4-2.

While the impact matrix is each project-specific, Table 4-2 may facilitate the stakeholders in identifying a set of components and phase-specific project activities for determination of likely impacts. However, the location-specific concerns may vary from case to case; therefore, the components even without likely impacts are also retained in the matrix for the location-specific reference.

Table 4-2: Matrix of Impacts

1	2	3	PHASE I					PHASE II							PHASE III								
			Pre Construction					Construction/ Establishment							Operation and Maintenance								
			4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22		
ENVIRONMENT	Component	Project Activities Parameter/factor	Detailed Topographic Survey	Land Acquisition	Site Clearing	Burning of wastes, refuse and cleared vegetation	Site Preparation / Change in Topography	Civil works such as earth moving and building of structures including temporary structures	Heavy Equipment operations	Disposal of construction wastes	Generation of sewerage	Influx of construction workers	Deforestation	Transportation of material	Movement of Energy Reserves	Crushing of coal, storage and handling/ stock piling	Operation of power source and generator facilities	Abstraction of water	Operation of cooling systems	Storage of chemicals/ flammables	Waste management (fly ash, sludge from water treatment plants, cooling tower, boiler, ETP etc.		
Physical	Soil	Erosion Risks																					
		Contamination						*

	Cultural	Land use																			
		Recreation																			
		Aesthetics and human interest																			
		Cultural status																			

Note:

1. The above table represents a model for likely impacts, which will have to be arrived case-to-case basis considering VECs and significance analysis (Ref Section 2.9).

2. Project activities are shown as indicative. However, in Form 1 (application for EIA Clearance), for any question for which answer is 'Yes', then the corresponding activity shall reflect in project activities. Similarly 'parameters'/'factors' will also be changed within a component in order to reflect the target species of prime concern in the receiving local environment.

4.3.5 Testing the significance of impacts

The following set of conditions may be used as the checklist for testing the significance of the impacts and also to provide information in Column IV of Form 1.

- Will there be a large change in environmental conditions?
- Will new features be out-of-scale with the existing environment?
- Will the effect be unusual in the area or particularly complex?
- Will the effect extend over a large area?
- Will there be any potential for trans-frontier impact?
- Will many people be affected?
- Will many receptors of other types (fauna and flora, businesses, facilities) be affected?
- Will valuable or scarce features or resources be affected?
- Is there a risk that environmental standards will be breached?
- Is there a risk that protected sites, areas, features will be affected?
- Is there a high probability of the effect occurring?
- Will the effect continue for a long time?
- Will the effect be permanent rather than temporary?
- Will the impact be continuous rather than intermittent?
- If it is intermittent will it be frequent rather than rare?
- Will the impact be irreversible?
- Will it be difficult to avoid, or reduce or repair or compensate for the effect?

For each "Yes" answer in column 3, the nature of effects and reasons for it should be recorded in the column 4. The questions are designed so that an "Yes" answer in column 3, will generally point towards the need for analyzing for the significance and requirement for conducting impact assessment for the effect.

4.3.6 Terms of reference for EIA studies

ToR for EIA studies in respect of the Thermal Power Plants include, but not limited to the following:

- 1) Executive summary of the project – giving a *prima facie* idea of the objectives of the proposal, use of resources, justification, etc. In addition, it should provide a compilation of EIA report including EMP and the post-project monitoring plan in brief.

Project Description

- 2) Justification for selecting the proposed unit size.

- 3) Land requirement for the project including its break up for various purposes, its availability and optimization. Norms prescribed by CEA should be kept in view.
- 4) Details of proposed layout clearly demarcating various units within the plant.
- 5) Complete process flow diagram describing each of the unit processes and operations, along with material and energy inputs & outputs (material and energy balance).
- 6) Details on requirement of raw materials, its source and storage at the plant.
- 7) Fuel analysis report (sulphur, ash content and mercury) including details of auxiliary fuel, if any. Details like quantity, quality, storage *etc.*,
- 8) Quantity of fuel required its source and transportation, a confirmed fuel linkage/ copy of the MoU.
- 9) Source of water and its availability. Proof regarding availability of requisite quantity of water from the competent authority.
- 10) Details on water balance including quantity of effluent generated, recycled & reused. Efforts to minimize effluent discharge and to maintain quality of receiving water body.
- 11) Details of effluent treatment plant, inlet and treated water quality with specific efficiency of each treatment unit in reduction in respect of all concerned/regulated environmental parameters.
- 12) Location of intake and outfall points (with coordinates) based on modeling studies. Details of modeling and the results obtained. It may be kept in view that the intake and outfall points are away from the mangroves.
- 13) Examine the feasibility of zero discharge. In case of any proposed discharge, its quantity, quality and point of discharge, users downstream, *etc.*
- 14) Explore the possibility of cooling towers installation. Details regarding the same.
- 15) Details regarding fly ash utilization as per new notification
- 16) Detailed plan of ash utilization / management.
- 17) Details of evacuation of ash.
- 18) Details regarding ash pond impermeability and whether it would be lined, if so details of the lining *etc.*
- 19) Details of desalination plant and disposal of sludge.
- 20) Details of proposed source-specific pollution control schemes and equipments to meet the national standards.
- 21) Details of the proposed methods of water conservation and recharging.
- 22) Management plan for solid/hazardous waste generation, storage, utilization and disposal.
- 23) Details regarding infrastructure facilities such as sanitation, fuel storage, restroom, *etc.* to the workers during construction and operation phase.
- 24) In case of expansion of existing industries, remediation measures adopted to restore the environmental quality if the groundwater, soil, crop, air, *etc.*, are affected and a detailed compliance to the prior environmental clearance/consent conditions.
- 25) Any litigation pending against the project and /or any direction /order passed by any Court of Law related to the environmental pollution and impacts in the last two years, if so, details thereof.

Description of the Environment

- 26) The study area shall be up to a distance of 10 km from the boundary of project area for air quality considerations in view of impacts occurring at distant locations once emitted from a tall stack particularly in view of absence of source control for SO₂ in tail gases whereas for impacts on other components (such as water, soil quality and noise monitoring, *etc.*) the study area may be up to a distance of 5 Km.
- 27) Location of the project site and nearest habitats with distances from the project site to be demarcated on a toposheet (1: 50000 scale).
- 28) Landuse based on satellite imagery including location specific sensitivities such as national parks / wildlife sanctuary, villages, industries, *etc.* for the study area.
- 29) Demography details of all the villages falling within the study area.
- 30) Topography details of the project area.
- 31) The baseline data to be collected from the study area w.r.t. different components of environment viz. air, noise, water, land, and biology and socio-economic (please refer Section 4.4.2 for guidance for assessment of baseline components and identify attributes of concern). Actual monitoring of baseline environmental components shall be strictly according to the parameters prescribed in the ToR after considering the proposed coverage of parameters by the proponent in draft ToR and shall commence after finalization of ToR by the competent Authority.
- 32) Geological features and geo-hydrological status of the study area.
- 33) Surface water quality of nearby water sources and other surface drains.
- 34) Details on ground water quality.
- 35) Details on water quality parameters such as Temperature, pH*, TOC*, Colour*, TDS*, BOD*, COD*, N (total)*, Mineral oils*, Free chlorine* , NH₃*, Fish*, toxicity*, Sb*, PAH Metals* (Co, Mn, Tl, V, Sn, Cd, Cr, Ni, Cu, Hg, Pb, Zn , *etc.*) CN*, S*, SO₃*, SO₄*, EOX*, Phenol*, PCDD/PCDF*, P (total) TSS*, Cl-*, FAs* , BTEX*, *etc.* (* - as applicable)
- 36) Details on existing ambient air quality and expected, stack and fugitive emissions for PM₁₀, PM 2.5, SO₂*, NO_x*, O₃*, VOCs*, Hg*, suspended particulates* *etc.*, and evaluation of the adequacy of the proposed pollution control devices to meet standards for point sources and to meet AAQ standards. (* - As applicable)
- 37) The air quality contours may be plotted on a location map showing the location of project site, habitation nearby, sensitive receptors, if any and wind roses.
- 38) Details on noise levels at sensitive/commercial receptors.
- 39) Site-specific micro-meteorological data including mixing height.
- 40) One season site-specific data excluding monsoon season.
- 41) Proposed baseline monitoring network for the consideration and approval of the Competent Authority.
- 42) Ecological status (terrestrial and aquatic) of the study area such as habitat type and quality, species, diversity, rarity, fragmentation, ecological linkage, age, abundance, *etc.*
- 43) If any incompatible land-use attributes fall within the study area, proponent shall describe the sensitivity (distance, area and significance) and propose the additional

points based on significance for review and acceptance by the EAC/SEAC. Incompatible land-use attributes include:

- Public water supply areas from rivers/surface water bodies, from ground water
- Scenic areas/tourism areas/hill resorts
- Religious places, pilgrim centers that attract over 10 lakh pilgrims a year
- Protected tribal settlements (notified tribal areas where industrial activity is not permitted)
- CRZ
- Monuments of national significance, World Heritage Sites
- Cyclone, Tsunami prone areas (based on last 25 years);
- Airport areas
- Any other feature as specified by the State or local government and other features as locally applicable, including prime agricultural lands, pastures, migratory corridors, *etc.*

44) If ecologically sensitive attributes fall within the study area, proponent shall describe the sensitivity (distance, area and significance) and propose the additional points based on significance for review and acceptance by the EAC/SEAC. Ecological sensitive attributes include:

- National parks
- Wild life sanctuaries Game reserve
- Tiger reserve/elephant reserve/turtle nesting ground
- Mangrove area
- Wetlands
- Reserved and Protected forests, *etc.*
- Any other closed/protected area under the Wild Life (Protection) Act, 1972, any other area locally applicable

45) If the location falls in a valley, studies on specific issues connected to the management of natural resources.

46) If the location is on Seashore: A CRZ map duly authenticated by one of the authorized agencies demarcating LTL, HTL, CRZ area, location of the project and associate facilities w.r.t. CRZ, coastal features such as mangroves, if any.

- Provide the CRZ map in 1:10000 scale in general cases and in 1:5000 scale for specific observations.
- Proposed site for disposal of dredged material and environmental quality at the point of disposal/impact areas.
- Fisheries study should be done w.r.t. Benthos and Marine organic material and coastal fisheries.

Anticipated Environmental Impacts and Mitigation Measures

47) Anticipated generic environmental impacts due to this project are indicated in Table 4-2, which may be evaluated for significance and based on corresponding likely impacts VECs may be identified. Baseline studies may be conducted for all the concerned VECs and likely impacts will have to be assessed for their magnitude in order to identify mitigation measures (please refer Chapter 4 of the manual for guidance).

48) Tools as given in Section 4.4.3 may be referred for the appropriate assessment of environmental impacts and same may be submitted in draft ToR for consideration and approval by EAC/SEAC.

- 49) Impact on drainage of the area and the surroundings.
- 50) Impact of the project on the AAQ of the area. Details of the model used and the input data used for modeling. The air quality contours may be plotted on a location map showing the location of project site, habitation nearby, sensitive receptors, if any. The wind roses should also be shown on this map.
- 51) Impact of the project on local infrastructure of the study area such as road network, *etc.* In case if the study area requires any additional infrastructure, details of the agency responsible for the same should be included along with the time frame. Details of the permission from Competent Authority for conveyor belt crossing the village road.
- 52) Impact of the activities to be taken up in the CRZ area including jetty and desalination plant *etc.*, should be integrated into the EIA report; however, action should be taken to obtain separate clearance from the competent authority as may be applicable to such activities.
- 53) Details of rainwater harvesting and its proposed usage in the plant.
- 54) Details regarding infrastructure facilities such as sanitation, fuel, restroom, *etc.*, to be provided to the workers during construction as well as to the casual workers including truck drivers during the operational phase.
- 55) Details of flora and fauna. Conservation plan in case of any scheduled fauna.
- 56) Proposed measures for occupational safety and health of the workers.
- 57) Oil spill control planning.
- 58) Off-shore coastal air dispersion models shall be applied.
- 59) Capital quantity of dredging material, disposal and its impact on aquatic life.
- 60) Fisheries study should be done with respect to Benthos and Marine organic material and coastal fisheries.
- 61) Proposed odour control measures.
- 62) Action plan for the greenbelt development – species, width of plantations, planning schedule *etc.* in accordance to CPCB published guidelines.
- 63) In case of likely impact from the proposed project on the surrounding reserve forests, Plan for the conservation of wild fauna in consultation with the State Forest Department.
- 64) For identifying the mitigation measures, please refer Chapter III for source control and treatment. Besides typical mitigation measures which may also be considered are discussed in Table 4-5.

Analysis of alternative resources and technologies

- 65) Comparison of alternate sites considered and the reasons for selecting the proposed site. Conformity of the site with the prescribed guidelines in terms of Coastal Regulatory Zone (CRZ), river, highways, railways *etc.*
- 66) Details of alternative sources of energy such as photovoltaic cells use in the plant for various applications.
- 67) Details on improved technologies.

Environmental Monitoring Program

- 68) Monitoring programme for pollution control at source.
- 69) Monitoring pollutants at receiving environment for the appropriate notified parameters – air quality, groundwater, surface water, *etc.* during operational phase of the project.
- 70) Specific programme to monitor safety and health protection of workers.
- 71) Appropriate monitoring network has to be designed and proposed, to assess the possible residual impacts on VECs.
- 72) Details of in-house monitoring capabilities and the recognized agencies if proposed for conducting monitoring.

Additional Studies

- 73) Details on risk assessment and damage control during different phases of the project and proposed safeguard measures.
- 74) Details on socio-economic development activities such as commercial property values, generation of jobs, education, social conflicts, cultural status, accidents, *etc.*
- 75) Proposed plan to handle the socio-economic influence on the local community. The plan should include quantitative dimension as far as possible.
- 76) Details on compensation package for the people affected by the project, considering the socio-economic status of the area, homestead oustees, land oustees, and landless labourers.
- 77) Points identified in the public hearing and commitment of the project proponent to the same. Detailed action plan addressing the issues raised, and the details of necessary allocation of funds.

Environmental Management Plan

- 78) Administrative and technical organizational structure to ensure proposed post-project monitoring programme for approved mitigation measures.
- 79) EMP devised to mitigate the adverse impacts of the project should be provided along with item-wise cost of its implementation (capital and recurring costs).
- 80) Allocation of resources and responsibilities for plan implementation.
- 81) Details of the emergency preparedness plan and on-site and off-site disaster management plan.

Note:

Above points shall be adequately addressed in the EIA report at corresponding chapters, in addition to the contents given in the reporting structure (Table 4-6).

4.4 Environmental Impact Assessment

The approach for accomplishing EIA studies is shown in Figure 4.3. Each stage is discussed in detail, in subsequent sections.

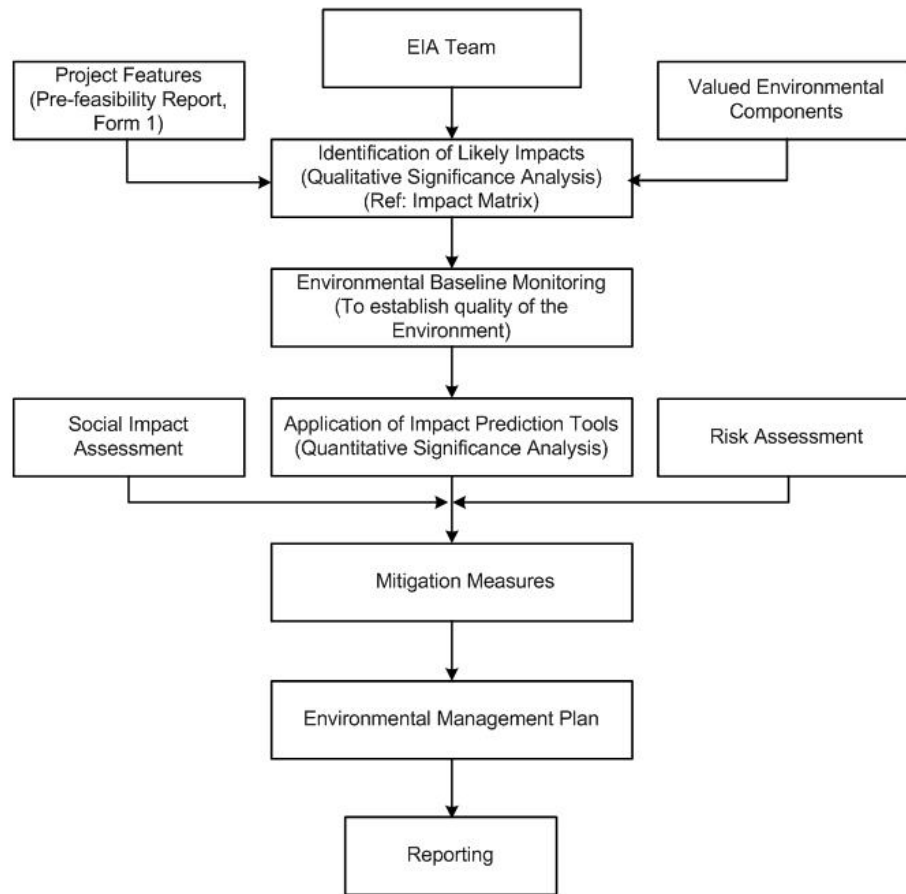

Figure 4-3: Approach for EIA Study

4.4.1 EIA team

The success of a multi-functional activity like an EIA primarily depends on constitution of a right team at the right time (preferable at the initial stages of an EIA) in order to assess the significant impacts (direct, indirect as well as cumulative impacts).

The professional Team identified for a specific EIA study should comprise of qualified and experienced professionals from various disciplines, in order to address the critical aspects identified for the specific project. Based on the nature and the environmental setting, following professionals may be identified for EIA studies:

- Environmental management specialist/regulator
- Air and noise quality
- Occupational health
- Geology/geo-hydrology
- Ecologist
- Transportation Specialist
- Safety and health specialist
- Social scientist, *etc.*

4.4.2 Baseline quality of the environment

EIA Notification 2006 specifies that an EIA Report should contain a description of the existing environment that would be or might be affected directly or indirectly by the proposed project. Environmental Baseline Monitoring (EBM) is a very important stage of EIA. On one hand EBM plays a very vital role in EIA and on the other hand, it provides feedback about the actual environmental impacts of a project. EBM during the operational phase helps in judging the success of mitigation measures in protecting the environment. Mitigation measures, in turn are used to ensure compliance with environmental standards, and to facilitate any needed project design or operational changes.

Description of the existing environment should include natural, cultural, socio-economic systems and their interrelationships. The intention is not to describe all baseline conditions, but to focus the collection and description of baseline data on those VECs that are important and are likely to be affected by the proposed industrial activity.

4.4.2.1 Objective of EBM in EIA context

The term 'baseline' refers to conditions existing before development against which subsequent changes can be referenced. EBM studies are carried out to:

- identify environmental conditions which might influence project design decisions (e.g., site layout, structural or operational characteristics);
- identify sensitive issues or areas requiring mitigation or compensation
- provide input data to analytical models used for predicting effects;
- provide baseline data against which the results of future monitoring programs can be compared.

At this stage of EIA process, EBM is primarily discussed in the context of first purpose wherein feedback from EBM programs may be used to:

- determine available assimilative capacity of different environmental components within the designated impact zone and whether more or less stringent mitigation measures are needed; and
- improve predictive capability of EIAs.

There are many institutional, scientific, quality control, and fiscal issues that must be addressed in implementation of an environmental monitoring program. Careful consideration of these issues in the design and planning stages will help avoid many of the pitfalls associated with environmental monitoring programs.

4.4.2.2 Environmental monitoring network design

Monitoring refers to the collection of data through a series of repetitive measurements of environmental parameters (or, more generally, to a process of systematic observation). Design of the environmental quality monitoring programme depends up on the monitoring objectives specified for the selected area of interest. Types of monitoring and network design considerations are discussed in **Annexure X**.

4.4.2.3 Baseline data generation

List of important physical environmental components and indicators of EBM are given in Table 4-3.

Table 4-3: List of Important Physical Environment Components and Indicators of EBM

Environmental Component	Environmental Indicators
Climatic variables	<ul style="list-style-type: none"> ▪ Rainfall patterns – mean, mode, seasonality ▪ Temperature patterns ▪ Extreme events ▪ Climate change projections ▪ Prevailing wind - direction, speed, anomalies ▪ Relative humidity ▪ Stability conditions and mixing height, <i>etc.</i>
Geology	<ul style="list-style-type: none"> ▪ Underlying rock type, texture ▪ Surgical material ▪ Geologic structures (faults, shear zones, <i>etc.</i>) ▪ Geologic resources (minerals, <i>etc.</i>)
Topography	<ul style="list-style-type: none"> ▪ Slope form ▪ Landform and terrain analysis ▪ Specific landform types, <i>etc.</i>
Coastal dynamics and morphology	<ul style="list-style-type: none"> ▪ Wave patterns ▪ Currents ▪ Shoreline morphology – near shore, foreshore ▪ Sediment – characteristics and transport, <i>etc.</i>
Soil	<ul style="list-style-type: none"> ▪ Type and characteristics ▪ Porosity and permeability ▪ Sub-soil permeability ▪ Run-off rate ▪ Infiltration capacity ▪ Effective depth (inches/centimeters) ▪ Inherent fertility ▪ Suitability for method of sewage disposal, <i>etc.</i>
Drainage	<ul style="list-style-type: none"> ▪ Surface hydrology ▪ Drainage network ▪ Rainfall runoff relationships ▪ Hydrogeology ▪ Groundwater characteristics – springs, <i>etc.</i>
Water	<ul style="list-style-type: none"> ▪ Raw water availability ▪ Water quality ▪ Surface water (rivers, lakes, ponds, gullies) – quality, water depths, flooding areas, <i>etc.</i> ▪ Ground water – water table, local aquifer storage capacity, specific yield, specific retention, water level depths and fluctuations, <i>etc.</i> ▪ Coastal ▪ Floodplains ▪ Wastewater discharges ▪ Waste discharges, <i>etc.</i>
Air	<ul style="list-style-type: none"> ▪ Ambient ▪ Respirable ▪ Airshed importance ▪ Odour levels, <i>etc.</i>

Environmental Component	Environmental Indicators
Noise	<ul style="list-style-type: none"> ▪ Identifying sources of noise ▪ Noise due to traffic/transportation of vehicles ▪ Noise due to heavy equipment operations ▪ Duration and variations in noise over time, <i>etc.</i>
Biological	<ul style="list-style-type: none"> ▪ Species composition of flora and fauna ▪ Flora – type, density, exploitation, <i>etc.</i> ▪ Fauna – distribution, abundance, rarity, migratory, species diversity, habitat requirements, habitat resilience, economic significance, commercial value, <i>etc.</i> ▪ Fisheries – migratory species, species with commercial/recreational value
Landuse	<ul style="list-style-type: none"> ▪ Landuse pattern, <i>etc.</i>

Guidance for assessment of baseline components and attributes describing sampling network, sampling frequency, method of measurement is given in **Annexure XI**.

Infrastructure requirements for EBM

In addition to devising a monitoring network design and monitoring plan/program, it is also necessary to ensure adequate resources in terms of staffing, skills, equipment, training, budget, *etc.*, for its implementation. Besides assigning institutional responsibility, reporting requirements, QA/QC plans and its enforcement capability are essential. A monitoring program that does not have an infrastructural support and QA/QC component will have little chance of success.

Defining data statistics/analyses requirements

The data analyses to be conducted are dictated by the objectives of environmental monitoring program. Statistical methods used to analyze data should be described in detail prior to data collection. This is important because repetitive observations are recorded in time and space. Besides, the statistical methods could also be chosen so that uncertainty or error estimates in the data can be quantified. For *e.g.*, statistical methods useful in an environmental monitoring program include: 1) frequency distribution analysis; 2) analysis of variance; 3) analysis of covariance; 4) cluster analysis; 5) multiple regression analysis; 6) time series analysis; 7) the application of statistical models.

Use of secondary data

The EBM program for EIA can, at best, address temporal and/or spatial variations limited to a certain extent because of cost implications and time limitations. Therefore analysis of all available information or data is essential to establish the regional profiles. So all the relevant secondary data available for different environmental components should be collated and analyzed.

To facilitate stake-holders, IL&FS Ecosmart Ltd., has made an attempt to compile the list of information required for EIA studies and the sources of secondary data, which are given in **Annexure XI A** and **Annexure XI B**.

4.4.3 Impact prediction tools

The scientific and technical credibility of an EIA relies on the ability of EIA practitioners to estimate the nature, extent, and magnitude of change in environmental components that may result from project activities. Information about predicted changes is needed for assigning impact significance, prescribing mitigation measures, designing & developing EMPs and post-project monitoring programs. The more accurate the predictions are, the more confident the EIA practitioner will be in prescribing specific measures to eliminate or minimize the adverse impacts of development project.

Choice of models/methods for impact predictions in respect to air, noise, water, land, biological and socio-economic environment are tabulated in **Annexure XIII**.

4.4.4 Significance of the impacts

Evaluating the significance of environmental effects is perhaps the most critical component of impact analysis.. The interpretation of significance bears directly on the subsequent EIA process and also during environmental clearance on project approvals and condition setting. At an early stage, it also enters into screening and scoping decisions on what level of assessment is required and which impacts and issues will be addressed.

Impact significance is also a key to choosing among alternatives. In total, the attribution of significance continues throughout the EIA process, from scoping to EIS review, in a gradually narrowing “cone of resolution” in which one stage sets up the next. But at this stage it is the most important as better understanding and quantification of impact significance is required.

One common approach is based on determination of the significance of predicted changes in the baseline environmental characteristics and compares these w.r.t regulatory standards, objective criteria and similar ‘thresholds’ as eco-sensitivity, cultural /religious values. Often, these are outlined in guidance. A better test proposed by the CEAA (1995) is to determine if ‘residual’ environmental effects are adverse, significant, and likely (given under). But at this stage, the practice of formally evaluating significance of residual impacts, *i.e.*, after predicting the nature and magnitude of impacts based on before-versus-after-project comparisons, and identifying measures to mitigate these effects is not being followed in a systematic way.

Step 1: Are the environmental effects adverse?

Criteria for determining if effects are “adverse” include:

- effects on biota health
- effects on rare or endangered species
- reductions in species diversity
- habitat loss
- transformation of natural landscapes
- effects on human health
- effects on current use of lands and resources for traditional purposes by aboriginal persons; and
- foreclosure of future resource use or production

Step 2: Are the adverse environmental effects significant?

Criteria for determining ‘significance’ are to judge that the impacts:

- are extensive over space or time
- are intensive in concentration or proportion to assimilative capacity
- exceed environmental standards or thresholds
- do not comply with environmental policies, landuse plans, sustainability strategy
- adversely and seriously affect ecologically sensitive areas
- adversely and seriously affect heritage resources, other landuses, community lifestyle and/or indigenous peoples traditions and values

Step 3: Are the significant adverse environmental effects likely?

Criteria for determining ‘likelihood’ include:

- probability of occurrence, and
- scientific uncertainty

4.5 Social Impact Assessment

Social impact assessment is the instrument used to analyze social issues and solicit stakeholder views for the design of projects. Social assessment helps make the project responsive to social development concerns, including seeking to enhance benefits for poor and vulnerable people while minimizing or mitigating risk and adverse impacts. It analyzes distributional impacts of intended project benefits on different stakeholder groups, and identifies differences in assets and capabilities to access the project benefits.

The scope and depth of SIA should be determined by the complexity and importance of issues studied, taking into account the skills and resources available. SIA should include studies related to involuntary resettlement, compulsory land acquisition, impact of imported workforces, job losses among local people, damage to sites of cultural, historic or scientific interest, impact on minority or vulnerable groups, child or bonded labour, use of armed security guards. However, SIA may primarily include the following:

Description of the socio-economic, cultural and institutional profile

Conduct a rapid review of available sources of information to describe the socio-economic, cultural and institutional interface in which the project operates.

Socio-economic and cultural profile: Describe the most significant social, economic and cultural features that differentiate social groups in the project area. Describe different interests in the project, and their levels of influence. Explain specific effects that the project may have on the poor and underprivileged. Identify any known conflicts among groups that may affect project implementation.

Institutional profile: Describe the institutional environment; consider both the presence and function of public, private and civil society institutions relevant to the operation. Are there important constraints within existing institutions e.g. disconnect between institutional responsibilities and the interests and behaviors of personnel within those institutions? Or are there opportunities to utilize the potential of existing institutions, e.g. private or civil society institutions, to strengthen implementation capacity

Legislative and regulatory considerations

To review laws and regulations governing the project's implementation and access of poor and excluded groups to goods, services and opportunities provided by the project. In addition, review the enabling environment for public participation and development planning. Social analysis should build on strong aspects of legal and regulatory systems to facilitate program implementation and identify weak aspects while recommending alternative arrangements.

Key social issues

The social analysis provides baseline information for designing social development strategy. The analysis should determine the key social and Institutional issues which affect the project objectives; identify the key stakeholder groups in this context and determine how relationships between stakeholder groups will affect or be affected by the project; and identify expected social development outcomes and actions proposed to achieve those outcomes.

Data collection and methodology

Describe the design and methodology for social analysis. In this regard:

- Build on existing data;
- Clarify the units of analysis for social assessment: intra-household, household level, as well as communities/settlements and other relevant social aggregations on which data is available or will be collected for analysis;
- Choose appropriate data collection and analytical tools and methods, employing mixed methods wherever possible; mixed methods include a mix of quantitative and qualitative methods.

Strategy to achieve social development outcomes

Identify the likely social development outcomes of the project and propose a social development strategy, including recommendations for institutional arrangements to achieve them, based on the findings of the social assessment. The social development strategy could include measures that:

- strengthen social inclusion by ensuring inclusion of both poor and excluded groups as intended beneficiaries in the benefit stream; offer access to opportunities created by the project
- empower stakeholders through their participation in design and implementation of the project, their access to information, and their increased voice and accountability (*i.e.*, a participation framework); and
- enhance security by minimizing and managing likely social risks and increasing the resilience of intended beneficiaries and affected persons to socio-economic shocks

Implications for analysis of alternatives

Review proposed approaches for the project, and compare them in terms of their relative impacts and social development outcomes. Consider what implications the findings of

social assessment might have on those approaches. Should some new components be added to the approach, or other components be reconsidered or modified?

If social analysis and consultation processes indicate that alternative approaches may have better development outcomes, such alternatives should be described and considered, along with the likely budgetary and administrative effects these changes might have.

Recommendations for project design and implementation arrangements

Provide guidance to project management and other stakeholders on how to integrate social development issues into project design and implementation arrangements. As much as possible, suggest specific action plans or implementation mechanisms to address relevant social issues and potential impacts. These can be developed as integrated or separate action plans, for example, as Resettlement Action Plans, Indigenous Peoples Development Plans, Community Development Plans, *etc.*

Developing a monitoring plan

Through social assessment process, a framework for monitoring and evaluation should be developed. To the extent possible, this should be done in consultation with key stakeholders, especially beneficiaries and affected people. The framework shall identify expected social development indicators, establish benchmarks, and design systems and mechanisms for measuring progress and results related to social development objectives. The framework shall identify organizational responsibilities in terms of monitoring, supervision, and evaluation procedures. Where possible, participatory monitoring mechanisms shall be incorporated. The framework should

- a set of monitoring indicators to track the progress achieved. The benchmarks and indicators should be limited in number, and should combine both quantitative and qualitative types of data. The indicators for outputs to be achieved by the social development strategy should include indicators to monitor the process of stakeholder participation, implementation and institutional reform
- indicators to monitor social risk and social development outcomes; and indicators to monitor impacts of the project's social development strategy. It is important to suggest mechanisms through which lessons learnt from monitoring and stakeholder feedback can result in changes to improve operation of the project. Indicators should be of such nature that results and impacts can be disaggregated by gender and other relevant social groups;
- define transparent evaluation procedures. Depending on context, these may include a combination of methods, such as participant observation, key informant interviews, focus group discussions, census and socio-economic surveys, gender analysis, Participatory Rural Appraisal (PRA), Participatory Poverty Assessment (PPA) methodologies, and other tools. Such procedures should be tailored to the special conditions of the project and to the different groups living in the project area; Estimate resource and budget requirements for monitoring and evaluation activities, and a description of other inputs (such as institutional strengthening and capacity building) needs to be carried out.

4.6 Risk Assessment

Industrial accidents results in great personal and financial loss. Managing these accidental risks in today's environment is the concern of every industry including TPPs,

because either real or perceived incidents can quickly jeopardize the financial viability of a business. Many facilities involve various manufacturing processes that have the potential for accidents which may be catastrophic to the plant, work force, environment, or public.

The main objective of risk assessment study is to propose a comprehensive but simple approach to carry out risk analysis and conducting feasibility studies for industries, planning and management of industrial prototype hazard analysis study in Indian context.

Risk analysis and risk assessment (Figure 4-4) should provide details on Quantitative Risk Assessment (QRA) techniques used world-over to determine risk posed to people who work inside or live near hazardous facilities, and to aid in preparing effective emergency response plans by delineating a Disaster Management Plan (DMP) to handle onsite and offsite emergencies. Hence, QRA is an invaluable method for making informed risk-based process safety and environmental impact planning decisions, as well as being fundamental to any decision while siting a facility. QRA whether, site-specific or risk-specific for any plant is complex and needs extensive study that involves process understanding, hazard identification, consequence modeling, probability data, vulnerability models/data, local weather and terrain conditions and local population data. QRA may be carried out to serve the following objectives:

- Identification of safety areas
- Identification of hazard sources
- Generation of accidental release scenarios for escape of hazardous materials from the facility
- Identification of vulnerable units with recourse to hazard indices
- Estimation of damage distances for the accidental release scenarios with recourse to Maximum Credible Accident (MCA) analysis
- Hazard and Operability studies (HAZOP) in order to identify potential failure cases of significant consequences
- Estimation of probability of occurrences of hazardous event through fault tree analysis and computation of reliability of various control paths
- Assessment of risk on basis of above evaluation against the risk acceptability criteria relevant to the situation
- Suggest risk mitigation measures based on engineering judgement, reliability and risk analysis approaches
- Delineation / upgradation of Disaster Management Plan (DMP)
- Safety Reports: with external safety report/ occupational safety report

The risk assessment report may cover the following in terms of the extent of damage with resource to MCA analysis and delineation of risk mitigations measures with an approach to DMP.

- Hazard identification – identification of hazardous activities, hazardous materials, past accident records, *etc.*
- Hazard quantification – consequence analysis to assess the impacts
- Risk Presentation
- Risk Mitigation Measures
- DMP

Figure 4-4: Risk Assessment – Conceptual Framework

Methods of risk prediction should cover all the design intentions and operating parameters to quantify risk in terms of probability of occurrence of hazardous events and magnitude of its consequence. Table 4-4 shows the predicted models for risk assessment.

Table 4-4: Guidance for Accidental Risk Assessment

Name	Application	Remarks for Power plants applications
EFFECT	Consequence Analysis for Visualization of accidental chemical release scenarios & its consequence	Heat load, press wave & toxic release exposure neutral gas dispersion
WHAZAN	Consequence Analysis for Visualization of accidental chemical release scenarios & its consequence	
EGADIS	Consequence Analysis for Visualization of accidental chemical release scenarios & its consequence	Dense gas dispersion
HAZOP and Fault Tree Assessment	For estimating top event probability	Failure frequency data is required
Pathways reliability and protective system hazard analysis	For estimating reliability of equipments and protective systems	Markov models
Vulnerability Exposure models	Estimation of population exposure	Uses probit equation for population exposure
F-X and F-N curves	Individual / Societal risks	Graphical Representation

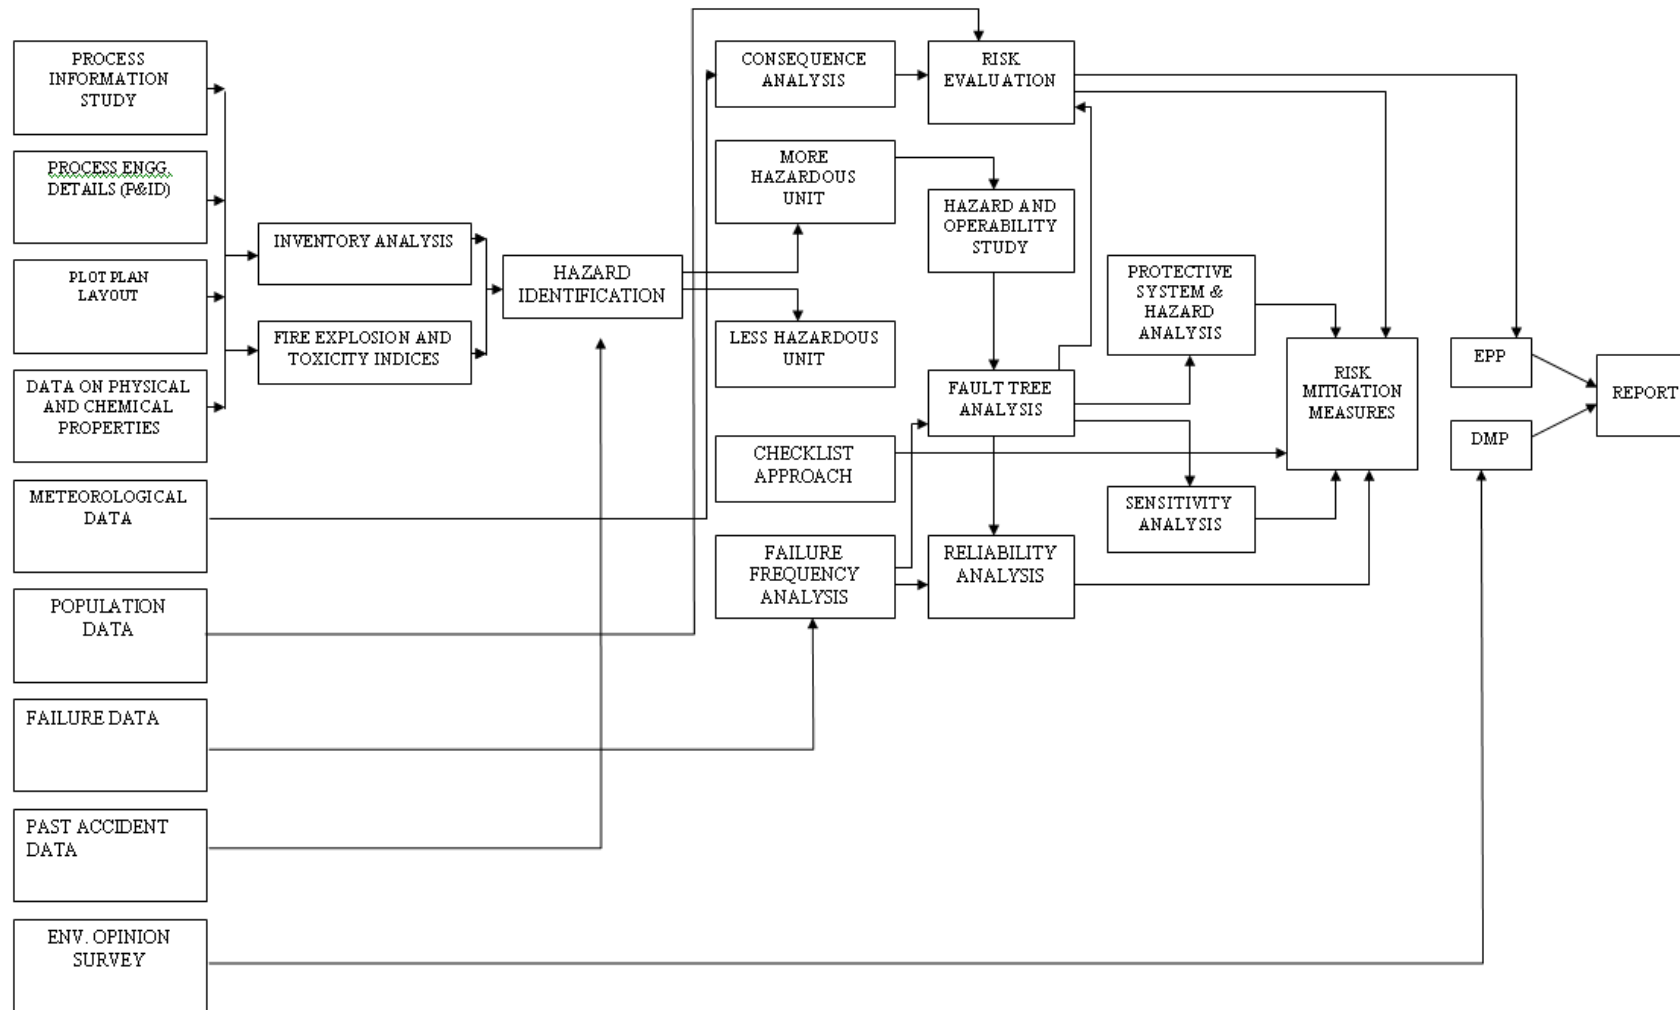

Figure 4-5: Comprehensive Risk Assessment - At a Glance

4.6.1 Disaster management plan

A disaster is a catastrophic situation in which suddenly, people are plunged into helplessness and suffering and, as a result, need protection, clothing, shelter, medical & social care and other necessities of life.

The Disaster Management Plan (DMP) is aimed to ensure safety of life, protection of environment, protection of installation, restoration of production and salvage operations in this same order of priorities. For effective implementation of DMP, it should be widely circulated and a personnel training is to be provided through rehearsals/drills.

To tackle the consequences of a major emergency inside the plant or immediate vicinity of the plant, a DMP has to be formulated and this planned emergency document is called DMP.

The objective of the DMP is to make use of the combined resources of the plant and the outside services to achieve the following:

- Effective rescue and medical treatment of casualties
- Safeguard other people
- Minimize damage to property and the environment
- Initially contain and ultimately bring the incident under control
- Identify any dead
- Provide for the needs of relatives
- Provide authoritative information to the news media
- Secure the safe rehabilitation of affected area
- Preserve relevant records and equipment for the subsequent inquiry into the cause and circumstances of the emergency

In effect, it is to optimize operational efficiency to rescue rehabilitation and render medical help and to restore normalcy.

The DMP should include Emergency Preparedness Plan, Emergency Response Team, Emergency Communication, Emergency Responsibilities, Emergency Facilities, and Emergency Actions

4.6.1.1 Emergency preparedness plan

Incidents, accidents and contingency preparedness should be accounted during construction and operation process. This shall be a part of EMS. Emergency Preparedness Plan (EPP) should be prepared following the National Environmental Emergency Plan and OSHA guidelines. According to these guidelines, an environmental emergency plan would essentially provide the following information:

- Assignment of duties and responsibilities among the authorities, participating agencies, response team, their coordinators and/or those responsible for the pollution incident
- Relationship with other emergency plans
- A reporting system that ensures rapid notification in the event of a pollution incident
- The establishment of a focal point for coordination and directions connected to the implementation of the plan

- Response operations should always cover these four phases:
 - Discovery and alarm
 - Evaluation, notification and plan invocation
 - Containment and counter measures
 - Cleanup and disposal
- Identification of expertise and response resources available for assistance for the implementation of plan
- Directions on the necessary emergency provisions applicable to the handling, treatment or disposal of certain pollutants
- Link to the local community for assistance, if necessary
- Support measures, such as procedures for providing public information, carrying out surveillance, issuing post-incident reports, review and updating of the plan, and periodic exercising of the plan.

4.6.1.2 Emergency response

Various industrial activities within the project facility are always subjected to accidents and incidents of many a kind. Therefore, a survey of potential incidents and accidents is to be carried out. Based on this, a plan for response to incidents, injuries and emergencies should be prepared. Response to emergencies should ensure that:

- The exposure of workers should be limited as much as possible during the operation
- Contaminated areas should be cleaned and, if necessary disinfected
- Limited impact on the environment at the extent possible.

Written procedures for different types of emergencies should be prepared and the entire workforce should be trained in emergency response. All relevant emergency response equipment should also be readily available.

With regard to dangerous spills, associated cleanup and firefighting operations should be carried out by specially allocated and trained personnel.

4.6.1.3 Response team

It is important to setup an Emergency Organization. A senior executive who has control over the affairs of the plant would be heading the Emergency Organization. He would be designated as Site Controller. Manager (Safety) would be designated as the Incident Controller. In case of stores, utilities, open areas, which are not under control of the Production Heads, Senior Executive responsible for maintenance of utilities would be designated as Incident Controller. All the Incident Controllers would be reporting to the Site Controller.

Each Incident Controller organizes a team responsible for controlling the incidence with the personnel under his control. Shift in charge would be the reporting officer, who would bring the incidence to the notice of the Incidence Controller and Site Controller.

Emergency Coordinators would be appointed who would undertake the responsibilities like firefighting, rescue, rehabilitation, transport and provide essential & support services.

For this purposes, Security In charge, Personnel Department, Essential services personnel would be engaged. All these personnel would be designated as key personnel.

In each shift, electrical supervisor, electrical fitters, pump house in charge, and other maintenance staff would be drafted for emergency operations. In the event of power or communication system failure, some of staff members in the office/facility would be drafted and their services would be utilized as messengers for quick passing of communications. All these personnel would be declared as essential personnel.

Response to injuries

Based on a survey of possible injuries, a procedure for response to injuries or exposure to hazardous substances should be established. All staff should have minimum training to such response and the procedure ought to include the following:

- Immediate first aid, such as eye splashing, cleansing of wounds and skin, and bandaging
- Immediate reporting to a responsible designated person
- If possible, retention of the item and details of its source for identification of possible hazards
- Rapid additional medical care from medical personnel
- Medical surveillance
- Recording of the incident
- Investigation, determination and implementation of remedial action

It is vital that incident reporting should be straightforward so that reporting is actually carried out.

4.6.1.4 Emergency communication

Whoever notices an emergency situation such as fire, growth of fire, leakage etc. would inform his immediate superior and Emergency Control Center. The person on duty in the Emergency Control Center, would appraise the Site Controller. Site Controller verifies the situation from the Incident Controller of that area or the Shift In charge and takes a decision about an impending On-site Emergency. This would be communicated to all the Incident Controllers, Emergency Coordinators. Simultaneously, the emergency warning system would be activated on the instructions of the Site Controller.

4.6.1.5 Emergency responsibilities

The responsibilities of the key personnel should be defined for the following:

- Site controller
- Incident controller
- Emergency coordinator - rescue, fire fighting
- Emergency coordinator-medical, mutual aid, rehabilitation, transport and communication
- Emergency coordinator - essential services
- Employers responsibility

Emergency facilities

- Emergency Control Center – with access to important personnel, telephone, fax, telex facility, safe contained breathing apparatus, hand tools, emergency shut down procedures, duties and contact details of key personnel and government agencies, emergency equipments, etc.
- Assembly Point – with minimum facilities for safety and rescue
- Emergency Power Supply – connected with diesel generator, flame proof emergency lamps, etc.
- Fire Fighting Facilities – first aid fire fighting equipments, fire alarms, etc.
- Location of wind Stock – located at appropriate location to indicate the direction of wind for emergency escape
- Emergency Medical Facilities – Stretchers, gas masks, general first aid, emergency control room, breathing apparatus, other emergency medical equipment, ambulance

Emergency actions

- Emergency warning
- Evacuation of personnel
- All clear signal
- Public information and warning
- Coordination with local authorities
- Mutual aid
- Mock drills

4.7 Mitigation Measures

The purpose of mitigation is to identify measures that safeguard the environment and the community affected by the proposal. Mitigation is both a creative and practical phase of the EIA process. It seeks best ways and means of avoiding, minimizing and remedying impacts. Mitigation measures must be translated into action in right way and at the right time, if they are to be successful. This process is referred to as impact management and takes place during project implementation. A written plan should be prepared for this purpose, and should include a schedule of agreed actions. Opportunities for impact mitigation will occur throughout the project cycle.

4.7.1 Important considerations for mitigation methods

The responsibility of project proponents to ‘internalize’ the full environmental costs of development proposals is now widely accepted under “Polluter Pay” principle. In addition, many proponents have found that good design and impact management can result in significant savings applying the principles of cleaner production to improve their environmental performance.

- The predicted adverse environmental as well as social impacts for which mitigation measures are required, should be identified and briefly summarized along with cross referencing them to the significance, prediction components of the EIA report or other documentation.
- Each mitigation measure should be briefly described w.r.t the impact of significances to which it relates and the conditions under which it is required (for example, continuously or in the event of contingencies). These should also be cross-referenced

to the project design and operating procedures which elaborate on the technical aspects of implementing the various measures.

- Cost and responsibilities for mitigation and monitoring should be clearly defined, including arrangements for coordination among various Authorities responsible for mitigation.
- The proponent can use the EMP to develop environmental performance standards and requirements for the project site as well as supply chain. An EMP can be implemented through Environment Management Systems (EMS) for the operational phase of the project.

Prior to selecting mitigation plans it is appropriate to study the mitigation alternatives for cost-effectivity, technical and socio-political feasibility. Such mitigation measures could include:

- avoiding sensitive areas such as eco-sensitive area, e.g., fish spawning areas, dense mangrove areas or areas known to contain rare or endangered species
- adjusting work schedules to minimize disturbance
- engineered structures such as berms and noise attenuation barriers
- pollution control devices such as scrubbers and electrostatic precipitators
- changes in fuel feed, manufacturing, process, technology use, or waste management practices, such as substituting a hazardous chemical with a non-hazardous one, or the re-cycling or re-use of waste materials

4.7.2 Hierarchy of elements of mitigation plan

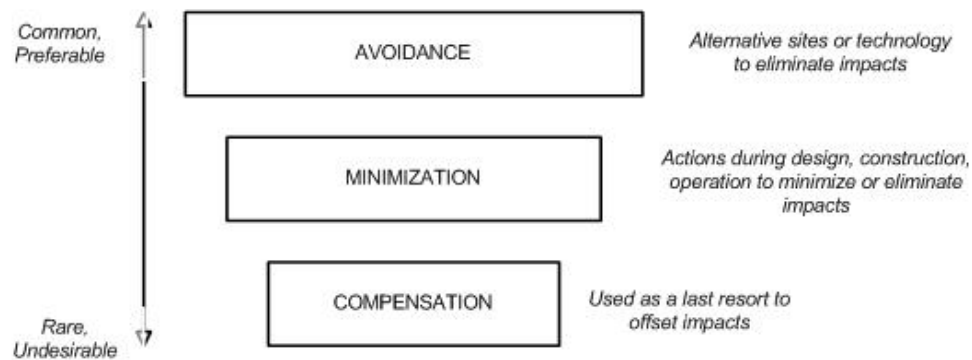

Figure 4-6: Hierarchy of Elements of Mitigation Plan

A good EIA practice requires a relevant technical understanding of the issues and the measures that work such given circumstances. The priority of selection of mitigation measures should be in the following order.

Step One: Impact avoidance

This step is most effective when applied at an early stage of project planning. It can be achieved by:

- not undertaking certain projects or elements that could result in adverse impacts
- avoiding areas that are environmentally sensitive; and
- Proper preventative measures to stop adverse impacts from occurring, for *e.g.*, release of water from a reservoir to maintain a fisheries regime.

Step Two: Impact minimization

This step is usually taken during impact identification and prediction to limit or reduce the degree, extent, magnitude, or duration of adverse impacts. It can be achieved by:

- scaling down or relocating the proposal
- redesigning elements of the project
- taking supplementary measures to manage the impacts

Step Three: Impact compensation

This step is usually applied to remedy unavoidable residual adverse impacts. It can be achieved by:

- rehabilitation of the affected site or environment, for example, by habitat enhancement and restocking fish;
- restoration of the affected site or environment to its previous state or better, as typically required for mine sites, forestry roads and seismic lines; and
- replacement of the same resource values at another location. For example, by wetland engineering to provide an equivalent area to that lost to drainage or infill.

Important Compensation Elements

Resettlement Plans: Special considerations apply to mitigation of proposals that displace or disrupt people. Certain types of projects, such as reservoirs and irrigation schemes and public works, are known to cause involuntary resettlement. This is a contentious issue because it involves far more than re-housing people; in addition, income sources and access to common property resources are likely to be lost. Almost certainly, a resettlement plan will be required to ensure that no one is worse off than before, which may not be possible for indigenous people whose culture and lifestyle is tied to a locality. This plan must include the means for those displaced to reconstruct their economies and communities and should include an EIA of the receiving areas. Particular attention should be given to indigenous, minority and vulnerable groups who are at higher risk from resettlement.

In-kind Compensation

When significant or net residual loss or damage to the environment is likely, in kind compensation is appropriate. As noted earlier, environmental rehabilitation, restoration or replacement have become standard practices for many proponents. Now, increasing emphasis is given to a broader range of compensation measures to offset impacts and assure the sustainability of development proposals. These include impact compensation ‘trading’, such as offsetting CO₂ emissions by planting forests to sequester carbon.

4.7.3 Typical mitigation measures

Choice of location for the developmental activity plays an important role in preventing adverse impacts on surrounding environment. Detailed guidelines on siting of industries

are provided in Section 4.2. However, if the developmental activity produces any more adverse impacts, mitigation measures should be taken.

Previous subsections of the Section 4.7 could be precisely summarized into following:

- Impacts from a developmental project could have many dimensions. As most of the direct impacts are caused by releases from developmental projects, often impact control at source is the best opportunity to either eliminate or mitigate the impacts, in case these are cost-effective. In other words, the best way to mitigate impacts is to prevent them from occurring. Choice of raw materials/technologies/processes which produce least impact would be one of the options to achieve it.
- After exploring cost-effective feasible alternatives to control impacts at source, various interventions to minimize adverse impacts may be considered. These interventions, primarily aim at reducing the residual impacts on the VECs of the receiving environment to acceptable concentrations.
- Degree of control at source and external interventions differs from situation-to - situation and is largely governed by techno-economic feasibility. While the regulatory bodies stress for further source control (due to high reliability), the project proponents bargain for other interventions which may be relatively cost-effective than further control at source (in any case, project authority is required to meet the industry-specific standards by adopting the best practicable technologies. However, if the location demands further control at source, then the proponents are required to adopt further advanced control technologies, *i.e.*, towards best available control technologies). After having discussions with the project proponent, EAC/SEAC reaches to an agreed level of source control+other interventions (together called as mitigation measures in the given context) that achieve the targeted protection levels for the VECs in the receiving environment. These levels will become the principal clearance conditions.
- Chapter 3 of this TGM offers elaborate information on cleaner technologies, waste minimization opportunities, and control technologies for various kinds of polluting parameters that emanate from this developmental activity. This information may be used to draw appropriate source control measures applicable at source.

The choice of interventions for mitigation of impacts may also be numerous and depend on various factors. Mitigation measures based on location-specific suitability and some other factors are discussed in sub-sections 4.7.1 and 4.7.2. A few typical measures which may also be explored for mitigation of impacts are listed in Table 4-5.

Table 4-5: Typical Mitigation Measures

Impacts	Mitigation steps
Soil	<ul style="list-style-type: none"> ▪ Windscreens, maintenance, and installation of ground cover ▪ Installation of drainage ditches ▪ Runoff and retention ponds ▪ Minimize disturbances and scarification of the surface ▪ Usage of appropriate monitoring and control facilities for construction equipments deployed ▪ Methods to reuse earth material generated during excavation
Resources – fuel / construction material, <i>etc.</i>	<ul style="list-style-type: none"> ▪ Optimization of resource use ▪ Availing resources with least impact – eco-efficiency options are applicable ▪ Availing the resources which could be replenished by natural

Impacts	Mitigation steps
	systems, etc.
Deforestation	<ul style="list-style-type: none"> ▪ Plant or create similar areas ▪ Initiate a tree planning program in other areas ▪ Donate land to conservationalist groups
Water pollution and issues	<ul style="list-style-type: none"> ▪ Conjunctive use of ground/surface water, to prevent flooding/water logging/depletion of water resources. Included are land use pattern, land filling, lagoon/reservoir/garland canal construction, and rainwater harvesting and pumping rate. ▪ Stormwater drainage system to collect surface runoff ▪ Minimise flow variation from the mean flow ▪ Storing of oil wastes in lagoons should be minimised in order to avoid possible contamination of the ground water system. ▪ All effluents containing acid/alkali/organic/toxic wastes should be properly treated. ▪ Monitoring of ground waters ▪ Use of biodegradable or otherwise readily treatable additives ▪ Neutralization and sedimentation of wastewaters, where applicable ▪ Dewatering of sludge and appropriate disposal of solids ▪ In case of oil waste, oil separation before treatment and discharge into the environment ▪ By controlling discharge of sanitary sewage and industrial waste into the environment ▪ By avoiding the activities that increases erosion or that contributes nutrients to water (thus stimulating alga growth) ▪ For wastes containing high TDS, treatment methods include removal of liquid and disposal of residue by controlled landfilling to avoid any possible leaching of the fills ▪ All surface runoffs around mines or quarries should be collected treated and disposed. ▪ Treated wastewater (such as sewage, industrial wastes, or stored surface runoffs) can be used as cooling water makeup. ▪ Wastewater carrying radioactive elements should be treated separately by means of de-watering procedures, and solids or brine should be disposed of with special care. ▪ Develop spill prevention plans in case of chemical discharges and spills ▪ Develop traps and containment system and chemically treat discharges on site
Air Pollution	<ul style="list-style-type: none"> ▪ Periodic checking of vehicles and construction machinery to ensure compliance to emission standards ▪ Attenuation of pollution/protection of receptor through green belts/green cover ▪ Dilution of odourant (dilution can change the nature as well as strength of an odour), odour counteraction or neutralize (certain pairs of odours in appropriate concentrations may neutralise each other), odour masking or blanketing (certain weaker malodours may be suppressed by a considerably stronger good odour). ▪ Regular monitoring of air polluting concentrations
Dust pollution	<ul style="list-style-type: none"> ▪ Adopt sprinkling of water ▪ Wetting of roadways to reduce traffic dust and re-entrained particles ▪ Control vehicle speed on sight ▪ Ensure periodical washing of construction equipment and transport vehicles to prevent accumulated dust ▪ Ensure that vehicles should be covered during transportation

Impacts	Mitigation steps
	<ul style="list-style-type: none"> ▪ Installation of windscreens to breakup the wind flow ▪ Burning of refuse on days when meteorological conditions provide for good mixing and dispersion ▪ Providing dust collection equipment at all possible points ▪ Maintaining dust levels within permissible limits ▪ Provision for masks when dust level exceeds
Noise pollution	<ul style="list-style-type: none"> ▪ Use of suitable muffler systems/enclosures/sound-proof glass paneling on heavy equipment/pumps/blowers ▪ Pumps and blowers may be mounted on rubber pads or any other noise absorbing materials ▪ Limiting certain activities ▪ Proper scheduling of high noise generating activities to minimise noise impacts ▪ Usage of well maintained construction equipment meeting the regulatory standards ▪ Placement of equipments emitting high noise in an orientation that directs the noise away from sensitive receptors ▪ Periodic maintenance of equipments/replacing whenever necessary/lubrication of rotating parts, etc. ▪ By using damping, absorption, dissipation, and deflection methods ▪ By using common techniques such as constructing sound enclosures, applying mufflers, mounting noise sources on isolators, and/or using materials with damping properties ▪ Performance specifications for noise represent a way to insure the procured item is controlled ▪ Use of ear protective devices. ▪ In case of steady noise levels above 85-dB (A), initiation of hearing conservation measures ▪ Implementation of greenbelt for noise attenuation may be taken up
Chemical discharges and spills	<ul style="list-style-type: none"> ▪ Develop spill prevention plans ▪ Develop traps and containment system and chemically treat discharges on site
Thermal shock to aquatic organisms	<ul style="list-style-type: none"> ▪ Use alternative heat dissipation design ▪ Dilute thermal condition by discharging water into larger receiving water body ▪ Install mechanical diffusers ▪ Cool water onsite in holding pond prior to discharge ▪ Explore opportunities to use waste heat
Biological	<ul style="list-style-type: none"> ▪ Installation of systems to discourage nesting or perching of birds in dangerous environments ▪ Increased employee awareness to sensitive areas
Social	<ul style="list-style-type: none"> ▪ Health and safety measures for workers ▪ Development of traffic plan that minimizes road use by workers ▪ Upgrade of roads and intersections ▪ Provide sufficient counseling and time to the affected population for relocation ▪ Discuss and finalize alternate arrangements and associated infrastructure in places of religious importance ▪ Exploration of alternative approach routes in consultation with local community and other stakeholders ▪ Provision of alternate jobs in unskilled and skilled categories
Worker exposure to dust from ash and coal	<ul style="list-style-type: none"> ▪ Provide dust collector equipment ▪ Maintain dust levels less than 10 mg/m³ ▪ Monitor for free silica content

Impacts	Mitigation steps
Marine	<ul style="list-style-type: none"> ▪ Provide dust masks when levels are exceeded ▪ Water quality monitoring program ▪ Limit construction activities to day time to provide recuperation time at night and reduce turbidity ▪ Prevention of spillage of diesel, oil, lubes, etc. ▪ Usage of appropriate system to barges/workboats for collection of liquid/solid waste generated onboard ▪ Avoid discharge of construction/dredging waste (lose silt) into sea. It may be disposed at the identified disposal point. ▪ Ensure usage of suitable/proper equipment for dredging in order to minimize the turbidity and suspensions at the dredging site. ▪ Checking with the compliance conditions before discharging wastes into the sea water ▪ Have a post-dredging monitoring programme in place ▪ Take up periodic maintenance dredging including inspection of sub-sea conditions, etc.
Solid/Hazardous waste	<ul style="list-style-type: none"> ▪ Proper handling of excavated soil ▪ Proper plan to collect and dispose off the solid waste generated onsite. ▪ Identify an authorized waste handler for segregation of construction and hazardous waste and its removal on a regular basis to minimize odour, pest and litter impacts ▪ Prohibit burning of refuse onsite.
Occupational health and safety	<ul style="list-style-type: none"> ▪ Provision of worker camps with proper sanitation and medical facilities, as well as making the worker camps self- sufficient with resources like water supply, power supply, etc ▪ Arrangement of periodic health check-ups for early detection and control of communicable diseases. ▪ Arrangement to dispose off the wastes at approved disposal sites. ▪ Provide preventive measures for potential fire hazards with requisite fire detection, fire-fighting facilities and adequate water storage

4.7.4 Mitigation Measure on Special Environmental Issues

Management of cooling tower & ash-pond effluents

Cooling towers result in high rates of water consumption, as well as the potential release of high temperature water containing high dissolved solids, residues of biocides, residues of other cooling system anti-fouling agents, *etc.* Recommended water management strategies include:

- Adoption of water conservation opportunities for facility cooling systems
- Use of heat recovery methods (also energy efficiency improvements) or other cooling methods to reduce the temperature of heated water prior to discharge to ensure the discharge water temperature does not result in an increase greater than 3°C of ambient temperature at the edge of a scientifically established mixing zone which takes into account ambient water quality, receiving water use, potential receptors and assimilative capacity among other considerations;
- Minimizing use of anti-fouling and corrosion inhibiting chemicals by ensuring appropriate depth of water intake and use of screens. Least hazardous alternatives

should be used with regards to toxicity, biodegradability, bioavailability, and bioaccumulation potential. Dose applied should accord with local SPCB requirements and manufacturer recommendations;

- Testing for residual biocides and other pollutants of concern should be conducted to determine the need for dose adjustments or treatment of cooling water prior to discharge.

Stormwater management

Stormwater includes any surface runoff and flows resulting from precipitation, drainage or other sources. Typically stormwater runoff contains suspended sediments, metals, petroleum hydrocarbons, Polycyclic Aromatic Hydrocarbons (PAHs), coliform, *etc.* Rapid runoff, even of uncontaminated stormwater, also degrades the quality of the receiving water by eroding stream beds and banks. In order to reduce the need for stormwater treatment, the following options should be checked:

- Stormwater should be separated from process and sanitary wastewater streams in order to reduce the volume of wastewater to be treated prior to discharge
- Surface runoff from process areas or potential sources of contamination should be prevented
- Where this approach is not practical, runoff from process and storage areas should be segregated from potentially less contaminated runoff
- Runoff from areas without potential sources of contamination be reduced (*e.g.*, by using vegetated swales and retention ponds)
- Where stormwater treatment is deemed necessary to protect the quality of receiving water bodies, priority should be given to managing and treating the first flush of stormwater runoff where the majority of potential contaminants tend to be present
- When water quality criteria allow, stormwater should be managed as a resource, either for groundwater recharge or for meeting water needs at the facility
- Oil water separators and grease traps should be installed and maintained as appropriate at refueling facilities, workshops, parking areas, fuel storage and containment areas.
- Sludge from stormwater catchments or collection and treatment systems may contain elevated levels of pollutants and should be disposed in compliance with local regulatory requirements, in the absence of which disposal has to be consistent with protection of public health and safety, and conservation and long term sustainability of water and land resources.

Sanitary wastewater management

Recommended sanitary wastewater management strategies include:

- Segregation of wastewater streams to ensure compatibility with selected treatment option (*e.g.*, septic system which can only accept domestic sewage);
- Segregation and pre-treatment of oil and grease containing effluents (*e.g.*, use of a grease trap) prior to discharge into sewer systems;
- If sewage from the industrial facility is to be discharged to surface water, treatment to meet national or local standards for sanitary wastewater discharges or, in their absence, the indicative guideline values applicable to sanitary wastewater discharges.

- If sewage from the industrial facility is to be discharged to either a septic system, or where land is used as part of the treatment system, treatment to meet applicable national or local standards for sanitary wastewater discharges is required.
- Sludge from sanitary wastewater treatment systems should be disposed in compliance with local regulatory requirements, in the absence of which disposal has to be consistent with protection of public health and safety, and conservation and long term sustainability of water and land resources.

Noise mitigation

Diverse noise-control measures can be introduced to reduce immissions to a tolerable level, whereas the primary goal must be to protect the TPP staff. To the extent possible, TPPs should be located an acceptable distance from residential areas, and all appropriate noise-control measures must be applied to the respective sound sources at the planning and construction stages.

Two particularly effective measures are the use of sound absorbers to reduce flow noises and the encapsulation of machines and respective devices to reduce air-borne and structure-borne sound levels. Appropriate enclosures constitute an additional means of simultaneously reducing both the emission and immission of noise. Incidentally, enclosures also provide weather protection and are therefore used widely in TPP engineering.

Fly ash utilization plans

The targets of ash utilization are primarily governed by the MoEF Notification dated 14th September, 1999 and its amendment Notification dated 27th August, 2003 as well as Hon'ble High Court of Delhi directions vide its judgments dated 4th December, 2002, 10th March, 2004 as well as 5th August, 2004. The existing TPPs as on September, 1999 are to achieve ash utilization level of 100% in a phased manner by 2013-14 in accordance with 15 year action plan as per Notification dated 14th September, 1999 and wef the date of publication of the Notification. The new TPP commissioned subsequent to September, 1999 are to achieve ash utilization level of 100% in a phased manner as per 9 year action plan and with effect from the date of publication of the Notification dated 14th September, 1999. Besides, the MoEF has also issued an amendment Notification dated 27th August, 2003 and has extended the scope of ash utilization by various construction agencies by stipulating specific targets for those within 50 km and 50 to 100 km radial distance of the location of TPP. Construction agencies located within 50 km are to achieve ash utilization level targets of 100 percent up to August, 2005 and those located from 50 to 100 km distance are to achieve ash utilization level of 100% by August, 2007.

**Figure 4-7: Fly Ash Utilization in Various Modes during 2006-07
(Mode, Quantity Utilized in Million Tonnes and Percentage)
(Total Fly Ash utilized = 55.01 MT)**

The options of ash utilization including the ash-based products are at developmental stage and need to be made more environment friendly by bringing in ash revolution. Some of the areas of application include:

- Brick/Block/Tiles Manufacturing
- Cement Manufacturing
- Roads and Embankment Construction
- Structural Fill for Reclaiming Low Lying Areas
- Mine-Filling
- Agriculture, Forestry and Waste-land Development
- Part Replacement of Cement in Mortar, Concrete and Ready Mix Concrete Hydraulic Structure (Roller Compacted Concrete)
- Ash Dyke Raising
- Building Components - Mortar, Concrete, Concrete Hollow Blocks, Aerated Concrete Blocks *etc.*
- Other Medium and High Value Added Products (Ceramic Tiles, Wood, Paints) Pavement Blocks, Light Weight Aggregate, Extraction of Alumina, Cenospheres, *etc.*

4.8 Environmental Management Plan

A typical EMP shall be composed of the following:

1. summary of potential impacts of the proposal ;
2. description of recommended mitigation measures ;
3. description of monitoring programme to ensure compliance with relevant standards and residual impacts
4. allocation of resources and responsibilities for plan implementation
5. implementation schedule and reporting procedures

6. contingency plan when impacts are greater than expected

Summary of impacts: The predicted adverse environmental and social impacts for which mitigation measures are identified in earlier sections to be briefly summarized with cross referencing to the corresponding sections in EIA report.

Description of mitigation measures: Each mitigation measure should be briefly described w.r.t the impact to which it relates and the conditions under which it is required. These should be accompanied by/ referenced to, project design and operating procedures which elaborate on the technical aspects of implementing various measures.

Description of monitoring programme to ensure compliance with relevant standards and residual impacts: Environmental monitoring refers to compliance monitoring and residual impact monitoring. Compliance monitoring refers to meeting the industry-specific statutory compliance requirements (Ref. Applicable National regulations as detailed in Chapter 3).

Residual impact monitoring refers to monitoring of identified sensitive locations with adequate number of samples and frequency. The monitoring programme should clearly indicate the linkages between impacts identified in the EIA report, measurement indicators, detection limits (where appropriate), and definition of thresholds that signal the need for corrective actions.

Allocation of resources and responsibilities for plan implementation: These should be specified for both the initial investment and recurring expenses for implementing all measures contained in the EMP, integrated into the total project costs, and factored into loan negotiation.

The EMP should contain commitments that are binding on the proponent in different phases of project implementation *i.e.*, pre-construction or site clearance, construction, operation, decommissioning.

Responsibilities for mitigation and monitoring should be clearly defined, including arrangements for coordination between various actors responsible for mitigation. Details should be provided w.r.t deployment of staff (detailed organogram), monitoring network design, parameters to be monitored, analysis methods, associated equipments *etc.*

Implementation schedule and reporting procedures: The timing, frequency and duration of mitigation measure should be specified in an implementation schedule, showing links with overall project implementation. Procedures to provide information on progress and results of mitigation and monitoring measures should also be clearly specified.

Contingency Plan when the impacts are greater than expected: There shall be a contingency plan for attending the situations where the residual impacts are higher than expected. It is an imperative requirement for all the project Authorities to plan additional programmes to deal with the situation, after duly intimating the concerned local regulatory bodies.

4.9 Reporting

Structure of the EIA report (Appendix III of the EIA Notification), applicable for TPP is given in the following Table 4.6. Each task prescribed in ToR shall be incorporated appropriately in the contents in addition to the contents described in the following Table.

Table 4-6: Structure of EIA Report

S.No	EIA Structure	Contents
1.	Introduction	<ul style="list-style-type: none"> ▪ Purpose of the report ▪ Identification of project & project proponent ▪ Brief description of nature, size, location of the project and its importance to the country, region ▪ Scope of the study – details of regulatory scoping carried out (As per Terms of Reference)
2.	Project Description	<p>Condensed description of those aspects of the project (based on project feasibility study), likely to cause environmental effects. Details should be provided to give clear picture of the following:</p> <ul style="list-style-type: none"> ▪ Type of project ▪ Need for the project ▪ Location (maps showing general location, specific location, project boundary & project site layout) ▪ Size or magnitude of operation (incl. Associated activities required by/r for the project) ▪ Proposed schedule for approval and implementation ▪ Technology and process description ▪ Project description including drawings showing project layout, components of project <i>etc.</i> Schematic representations of feasibility drawings which give information important for EIA ▪ Description of mitigation measures incorporated into the project to meet environmental standards, environmental operating conditions, or other EIA requirements (as required by the scope) ▪ Assessment of New & untested technology for the risk of technological failure
3.	Description of the Environment	<ul style="list-style-type: none"> ▪ Study area, period, components & methodology ▪ Establishment of baseline for VECs, as identified in the scope ▪ Base maps of all environmental components
4.	Anticipated Environmental Impacts & Mitigation Measures	<ul style="list-style-type: none"> ▪ Details of Investigated Environmental impacts due to project location, possible accidents, project design, project construction, regular operations, final decommissioning or rehabilitation of a completed project ▪ Measures for minimizing and / or offsetting adverse impacts identified ▪ Irreversible and irretrievable commitments of environmental components ▪ Assessment of significance of impacts (Criteria for determining significance, Assigning significance) ▪ Mitigation measures
5.	Analysis of Alternatives (Technology & Site)	<ul style="list-style-type: none"> ▪ In case, the scoping exercise results in need for alternatives: ▪ Description of each alternative ▪ Summary of adverse impacts of each alternative ▪ Mitigation measures proposed for each alternative and selection of alternative
6.	Environmental Monitoring Program	<ul style="list-style-type: none"> ▪ Technical aspects of monitoring the effectiveness of mitigation measures (incl. Measurement methodologies, frequency, location, data analysis, reporting schedules, emergency procedures, detailed budget & procurement

S.No	EIA Structure	Contents
		schedules)
7.	Additional Studies	<ul style="list-style-type: none"> ▪ Public Consultation ▪ Risk assessment ▪ Social Impact Assessment, R&R Action Plans
8.	Project Benefits	<ul style="list-style-type: none"> ▪ Improvements in physical infrastructure ▪ Improvements in social infrastructure ▪ Employment potential –skilled; semi-skilled and unskilled ▪ Other tangible benefits
9.	Environmental Cost Benefit Analysis	<ul style="list-style-type: none"> ▪ If recommended at the Scoping stage
10.	EMP	<ul style="list-style-type: none"> ▪ Description of administrative aspects that ensure proper implementation of the mitigative measures and their effectiveness monitored, after approval of the EIA
11.	Summary & Conclusion (This will constitute the summary of the EIA Report)	<ul style="list-style-type: none"> ▪ Overall justification for implementation of the project ▪ Explanation of how, adverse effects have been mitigated
12.	Disclosure of Consultants engaged	<ul style="list-style-type: none"> ▪ Names of the Consultants engaged with their brief resume and nature of Consultancy rendered

4.10 Public Consultation

Public consultation refers to the process by which the concerns of local affected people and others who have plausible stake in the environmental impacts of the project or activity are ascertained.

- Public consultation is not a decision taking process, but is a process to collect views of the people having plausible stake. If the SPCB/Public agency conducting public hearing is not convinced with the plausible stake, then such expressed views need not be considered.
- All Category A and Category B1 projects require public hearing except the following:
 - Once environmental clearance is granted to an industrial estates/SEZs/ EPZs etc., for a given composition (type and capacity) of industries, then individual units will not require public hearing.
 - Expansion of roads and highways, which do not involve any further acquisition of land.
 - Maintenance dredging provided the dredged material shall be disposed within port limits
 - All building/ construction projects/ area development projects/townships
 - All Category B2 projects
 - All projects concerning national defense and security or involving other strategic considerations as determined by the Central Government
- Public consultation involves two components, one is public hearing, and other one is inviting written responses/objections through Internet/by post, etc., by placing the summary of EIA report on the website.
- Public hearing shall be carried out at the site or in its close proximity, district-wise, for ascertaining concerns of local affected people.

- Project proponent shall make a request through a simple letter to the Member Secretary of the SPCB or UTPCC to arrange public hearing.
- Project proponent shall enclose with the letter of request, at least 10 hard copies and 10 soft copies of the draft EIA report including the summary EIA report in English and in official language of the State/local language prepared as per the approved scope of work, to the concerned Authority.
- Simultaneously, project proponent shall arrange to send, one hard copy and one soft copy, of the above draft EIA report along with the summary EIA report to the following Authorities within whose jurisdiction the project will be located:
 - District magistrate(s) /District Collector/Deputy Commissioner (s)
 - Zilla parishad and municipal corporation or panchayats union
 - District industries office
 - Urban local bodies (ULBs)/PRIs concerned/development authorities
 - Concerned regional office of the MoEF/SPCB
- Above mentioned Authorities except regional office of MoEF shall arrange to widely publicize the draft EIA report within their respective jurisdictions requesting the interested persons to send their comments to the concerned regulatory Authorities. They shall also make draft EIA report for inspection electronically or otherwise to the public during normal office hours till the public hearing is over.
- Concerned regulatory Authority (MoEF/SEIAA/UTEIA) shall display the summary of EIA report on its website and also make full draft EIA report available for reference at a notified place during normal office hours at their head office.
- SPCB or UTPCC concerned shall also make similar arrangements for giving publicity about the project within the State/UT and make available the summary of draft EIA report for inspection in select offices, public libraries or any other suitable location, *etc.* They shall also additionally make available a copy of the draft EIA report to the five authorities/offices as mentioned above.
- The Member-Secretary of the concerned SPCB or UTPCC shall finalize the date, time and exact venue for the conduct of public hearing within seven days of the date of the receipt of the draft EIA report from the project proponent and advertise the same in one major National Daily and one Regional vernacular Daily/official State language.
- A minimum notice period of 30 (thirty) days shall be provided to the public for furnishing their responses.
- No postponement of the date, time, venue of the public hearing shall be undertaken, unless some untoward emergency situation occurs. Only in case of emergencies and up on recommendation of the concerned District Magistrate/District Collector/Deputy Commissioner the postponement shall be notified to the public through the same National and Regional vernacular dailies and also prominently displayed at all the identified offices by the concerned SPCB or UTPCC
- In the above exceptional circumstances fresh date, time and venue for the public consultation shall be decided by the Member–Secretary of the concerned SPCB or UTPCC only in consultation with the District Magistrate/District Collector/Deputy Commissioner and notified afresh as per the procedure.
- The District Magistrate/District Collector/Deputy Commissioner or his or her representative not below the rank of an Additional District Magistrate assisted by a representative of SPCB or UTPCC, shall supervise and preside over the entire public hearing process.

- The SPCB or UTPCC shall arrange to video film the entire proceedings. A copy of the videotape or a CD shall be enclosed with the public hearing proceedings while forwarding it to the Regulatory Authority concerned.
- The attendance of all those who are present at the venue shall be noted and annexed with the final proceedings
- There shall be no quorum required for attendance for starting the proceedings
- Persons present at the venue shall be granted the opportunity to seek information or clarifications on the project from the proponent. The summary of the public hearing proceedings accurately reflecting all the views and concerns expressed shall be recorded by the representative of the SPCB or UTPCC and read over to the audience at the end of the proceedings explaining the contents in the local/vernacular language and the agreed minutes shall be signed by the District Magistrate/District Collector/Deputy Commissioner (s) or his or her representative on the same day and forwarded to the SPCB/UTPCC concerned.
- A statement of the issues raised by the public and the comments of the proponent shall also be prepared in the local language or the official State language, as the case may be and in English and annexed to the proceedings.
- The proceedings of the public hearing shall be conspicuously displayed at the office of the Panchayats within whose jurisdiction the project is located, office of the concerned Zilla Parishad, District Magistrate/District Collector/Deputy Commissioner, and the SPCB or UTPCC. The SPCB or UTPCC shall also display the proceedings on its website for general information. Comments, if any, on the proceedings, may be sent directly to the concerned regulatory authorities and the Applicant concerned.
- The public hearing shall be completed within a period of 45 (forty five) days from date of receipt of the request letter from the Applicant. Therefore the SPCB or UTPCC concerned shall send public hearing proceedings to the concerned regulatory authority within eight (8) days of the completion of the public hearing. Simultaneously, a copy will also be provided to the project proponent. The proponent may also directly forward a copy of the approved public hearing proceedings to the regulatory authority concerned along with the final EIA report or supplementary report to the draft EIA report prepared after the public hearing and public consultations incorporating the concerns expressed in the public hearing along with action plan and financial allocation, item-wise, to address those concerns.
- Upon receipt of the same, the Authority will place executive summary of the report on the website to invite responses from other concerned persons having a plausible stake in the environmental aspects of the project or activity.
- If SPCB/UTPCC is unable to conduct public hearing in the prescribed time, the Central Government in case of Category A projects and State Government or UT administration in case of Category B projects at the request of SEIAA may engage any other agency or Authority for conducting the public hearing process within a further period of 45 days. The respective governments shall pay appropriate fee to the public agency for conducting public hearing.
- A public agency means a non-profit making institution/ body such as technical/academic institutions, government bodies not subordinate to the concerned Authority.
- If SPCB/Public Agency authorized for conducting public hearing informs the Authority, stating that it is not possible to conduct the public hearing in a manner,

which will enable the views of the concerned local persons to be freely expressed, then Authority may consider such report to take a decision that in such particular case, public consultation may not have the component of public hearing.

- Often restricting the public hearing to the specific district may not serve the entire purpose, therefore, NGOs who are local and registered under the Societies Act in the adjacent districts may also be allowed to participate in public hearing, if they so desire.
- Confidential information including non-disclosable or legally privileged information involving intellectual property right, source specified in the application shall not be placed on the website.
- The Authority shall make available on a written request from any concerned person, the draft EIA report for inspection at a notified place during normal office hours till the date of the public hearing.
- While mandatory requirements will have to be adhered to, utmost attention shall be given to the issues raised in the public hearing for determining the modifications needed in the project proposal and the EMP to address such issues.
- Final EIA report after making needed amendments, as aforesaid, shall be submitted by the applicant to the concerned Authority for prior environmental clearance. Alternatively, a supplementary report to draft EIA and EMP addressing all concerns expressed during the public consultation may be submitted.

4.11 Appraisal

Appraisal means the detailed scrutiny by the EAC or SEAC of the application and the other documents like the final EIA report, outcome of the public consultation including public hearing proceedings submitted by the applicant for grant of environmental clearance.

- The appraisal shall be made by EAC to the Central Government or SEAC to SEIAA.
- Project proponent either personally or through consultant can make a presentation to EAC/SEAC for the purpose of appraising the features of the project proposal and also to clarify the issues raised by the members of the EAC/SEAC.
- On completion of these proceedings, concerned EAC/SEAC shall make categorical recommendations to the respective Authority, either for grant of prior environmental clearance on stipulated terms & conditions, if any, or rejection of the application with reasons.
- In case EAC/SEAC needs to visit the site or obtain further information before being able to make categorical recommendations, EAC/SEAC may inform the project proponent accordingly. In such an event, it should be ensured that the process of environmental clearance is not unduly delayed to go beyond the prescribed timeframe.
- Up on the scrutiny of the final report, if EAC/SEAC opines that ToR for EIA studies finalized at the scoping stage has not been comprehensively covered by the proponent, then the project proponent may be asked to provide such information. If such information is declined by the project proponent or is unlikely to be provided early enough so as to complete the environmental appraisal within prescribed time of 60 days, the EAC/SEAC may recommend for rejection of the proposal with the same reason.

- Appraisal shall be strictly in terms of ToR for EIA studies finalized at the scoping stage and the concerns expressed during public consultation.
- This process of appraisal shall be completed within 60 days from the receipt of the updated EIA and EMP reports, after completing public consultation.
- The EIA report will be typically examined for following:
 - Project site description supported by topographic maps & photographs – detailed description of topography, land use and activities at the proposed project site and its surroundings (buffer zone) supported by photographic evidence.
 - Clarity in description of drainage pattern, location of eco-sensitive areas, vegetation characteristics, wildlife status - highlighting significant environmental attributes such as feeding, breeding and nesting grounds of wildlife species, migratory corridor, wetland, erosion and neighboring issues.
 - Description of the project site – how well the interfaces between the projects related activities and the environment have been identified for the entire project cycle *i.e.*, construction, operation and decommissioning at the end of the project life.
 - How complete and authentic are the baseline data pertaining to flora and fauna and socio-economic aspects?
 - Citing of proper references, with regard to the source(s) of baseline data as well as the name of the investigators/investigating agency responsible for collecting the primary data.
 - How consistent are the various values of environmental parameters with respect to each other?
 - Is a reasonable assessment of the environmental and social impact made for the identified environmental issues including project affected people?
 - To what extent the proposed environmental plan will mitigate the environmental impact and at what estimated cost, shown separately for construction, operation and closure stages and also separately in terms of capital and recurring expenses along with details of agencies that will be responsible for the implementation of environmental plan/ conservation plan.
 - How well the concerns expressed/highlighted during public hearing have been addressed and incorporated in the EMP giving item wise financial provisions and commitments (in quantified terms)?
 - How far the proposed environmental monitoring plan will effectively evaluate the performance of EMP? Are details for environmental monitoring plan provided in the same manner as the EMP?
 - Identification of hazard and quantification of risk assessment and whether appropriate mitigation plan has been included in the EMP?
 - Does the proposal include a well formulated, time bound green belt development plan for mitigating environmental problems such as fugitive emissions of dust, gaseous pollutants, noise, odour, *etc.*?
 - Does EIA make a serious attempt to guide the project proponent for minimizing the requirement of natural resources including land, water energy and other non renewable resources?
 - How well has the EIA statement been organized and presented so that the issues, their impact and environmental management strategies emerge clearly from it and how well organized was the power point presentation made before the expert committee?
 - Is the information presented in EIA adequately and appropriately supported by maps, imageries and photographs highlighting site features and environmental attributes?

4.12 Decision-Making

The Chairperson reads the sense of the Committee and finalizes the draft minutes of the meeting, which are circulated by the Secretary to all expert members invited to the meeting. Based on the response from the members, the minutes are finalized and signed by the Chairperson. This process for finalization of the minutes should be so organized that the time prescribed for various stages is not exceeded.

Approval / Rejection / Reconsideration

- The Authority shall consider the recommendations of concerned appraisal Committee and convey its decision within 45 days of the receipt of recommendations.
- If the Authority disagrees with the recommendations of the Appraisal Committee, then reasons shall be communicated to concerned Appraisal Committee and applicant within 45 days from the receipt of the recommendations. The Appraisal Committee concerned shall consider the observations of the Authority and furnish its views on the observations within further period of 60 days. The Authority shall take a decision within the next 30 days based on the views of appraisal Committee.
- If the decision of the Authority is not conveyed within the time, then the proponent may proceed as if the environmental clearance sought has been granted or denied by the regulatory authority in terms of the final recommendation of the concerned appraisal Committee. For this purpose, the decision of the Appraisal Committee will be a public document, once the period specified above for taking the decision by the Authority is over.
- In case of the Category B projects, application shall be received by the Member Secretary of the SEIAA and clearance shall also be issued by the same SEIAA.
- Deliberate concealment and/or submission of false or misleading information or data which is material to screening or scoping or appraisal or decision on the application shall make the application liable for rejection, and cancellation of prior environmental clearance granted on that basis. Rejection of an application or cancellation of a prior environmental clearance already granted, on such ground, shall be decided by the regulatory authority, after giving a personal hearing to the applicant, and following the principles of natural justice.

If Approved

- MoEF or concerned SEIAA will issue the environmental clearance for the project.
- The project proponent should make sure that the award of Environment Clearance is properly publicized in at least two local newspapers of the district or state where the proposed project is located. For instance, the executive summary of the environmental clearance may be published in the newspaper along with the information about the location (website/office where it is displayed for public) where the detailed environmental clearance is made available. The MoEF and SEIAA/UTEIAA, as the case may be, shall also place the environmental clearance in the public domain on Government Portal. Further copies of the environmental clearance shall be endorsed to the Heads of local bodies, Panchayats and Municipal bodies in addition to the relevant offices of the Government.
- The environmental clearance will be valid from the start date to actual commencement of the production of the developmental activity.

- Usual validity period will be 5 years from the date of issuing environmental clearance, unless specified by EAC/SEAC.
- A prior environmental clearance issued to a project proponent can be transferred to another legal person entitled to undertake the project, upon application by the transferor to the concerned Authority or submission of no-objection of the transferor by the transferee to the concerned Authority for the concurrence. In this case, EAC/SEAC concurrence is not required, but approval from the concerned authority is required to avail the same project configurations, validity period transferred to the new legally entitled person to undertake the project.

4.13 Post-Clearance Monitoring Protocol

The MoEF, Government of India will monitor and take appropriate action under the Environment (Protection) Act, 1986, the laboratories recognized by the CPCB.

- In respect of Category A projects, it shall be mandatory for the project proponent to make public the environmental clearance granted for their project along with the environmental conditions and safeguards at their cost by advertising it at least in two local newspapers of the district or State where the project is located and in addition, this shall also be displayed in the project proponent's website permanently.
- In respect of Category B projects, irrespective of its clearance by MoEF/SEIAA, the project proponent shall prominently advertise in the newspapers indicating that the project has been accorded environment clearance and the details of MoEF website where it is displayed.
- The MoEF and the SEIAAs/UTEIAAs, as the case may be, shall also place the environmental clearance in the public domain on Government Portal.
- Copies of environmental clearance shall be submitted by the project proponents to the Heads of the local bodies, Panchayats and Municipal bodies in addition to the relevant offices of the Government who in turn have to display the same for 30 days from the date of receipt.

The project proponent must submit half-yearly compliance reports in respect of the stipulated prior environmental clearance terms and conditions in hard and soft copies to the regulatory authority concerned, on 1st June and 1st December of each calendar year.

All such compliance reports submitted by the project management shall be public documents. Copies of the same shall be given to any person on application to the concerned regulatory authority. Such latest such compliance report shall also be displayed on the website of the concerned regulatory Authority.

The SPCB shall incorporate EIA clearance conditions into consent conditions in respect of Category A and Category B projects and in parallel shall monitor and enforce the same.

5.

STAKEHOLDERS' ROLES AND RESPONSIBILITIES

Prior environmental clearance process involves many stakeholders *i.e.*, Central Government, State Government, SEIAA, EAC at the National Level, SEAC, the public agency, SPCB, the project proponent, and the public.

- Roles and responsibilities of the organizations involved in different stages of prior environmental clearance are listed in Table 5-1.
- Organization-specific functions are listed in Table 5-2.

In this Chapter, constitution, composition, functions, *etc.*, of the Authorities and the Committees are discussed in detail.

Table 5-1: Roles and Responsibilities of Stakeholders Involved in Prior Environmental Clearance

Stage	MoEF/SEIAA	EAC/SEAC	Project Proponent	EIA Consultant	SPCB/ Public Agency	Public and Interest Group
Screening	Receives application and takes advice of MoEF/SEAC	Advises the MoEF/SEIAA	Submits application (Form 1) and provides necessary information	Advises and assists the proponent by providing technical information		
Scoping	Approves the ToR, communicates the same to the project proponent and places the same in the website	Reviews the ToR, visits the proposed site, if required, and recommends the ToR to the MoEF/SEIAA	Submits the draft ToR to MoEF/SEIAA and facilitates the visit of the EAC/SEAC members to the project site	Prepares ToR		
EIA Report & Public Hearing	Reviews and forwards copies of the EIA report to SPCB /public agency for conducting public hearing		Submits detailed EIA report as per the finalized ToR Facilitates the public hearing by arranging presentation on the project, EIA and EMP – takes note of	Prepares the EIA report Presents and appraises the likely impacts and pollution control measures proposed in the public hearing	Reviews EIA report and conducts public hearing in the manner prescribed Submits proceedings and views of SPCB,	Participates in public hearings and offers comments and observations Comments can be sent directly to SEIAA

Stakeholders' Roles and Responsibilities

	Places the summary of EIA report in the website Conveys objections to the project proponent for update, if any		objections and updates the EMP accordingly		to the Authority and the project proponent as well	through Internet in response to the summary placed in the website
Appraisal and Clearance	Receives updated EIA Takes advice of EAC/SEAC, approves EIA and attaches the terms and conditions	Critically examines the reports, presentation of the proponent and appraises MoEF/SEIAA (recommendations are forwarded to MoEF/SEIAA)	Submits updated EIA, EMP reports to MoEF/SEIAA. Presents the overall EIA and EMP including public concerns to EAC/SEAC	Provides technical advise to the project proponent and if necessary presents the proposed measures for mitigation of likely impacts (terms and conditions of clearance)		
Post-clearance Monitoring			Implements environmental protection measures prescribed and submits periodic monitoring results	Conducts periodic monitoring	Incorporates the clearance conditions into appropriate consent conditions and ensures implementation	

Table 5-2: Organization-specific Functions

Organization	Functions
Central Government	<ul style="list-style-type: none"> ▪ Constitutes the EAC ▪ Considering recommendations of the State Government, constitutes the SEIAA & SEAC ▪ Receives application from the project proponent in case of Category A projects or Category B projects attracting general condition ▪ Communicates the ToR finalized by the EAC to the project proponent. ▪ Receives EIA report from the project proponent and soft copy of summary of the report for placing in the website ▪ Summary of EIA report will be placed in website. Forwards the received responses to the project proponent

Stakeholders' Roles and Responsibilities

	<ul style="list-style-type: none"> ▪ Engages other public agency for conducting public hearings in cases where the SPCB does not respond within time ▪ Receives updated EIA report from project proponent incorporating the considerations from the proceedings of public hearing and responses received through other media ▪ Forwards updated EIA report to the EAC for appraisal ▪ Either accepts the recommendations of EAC or asks for reconsideration of specific issues for review by the EAC. ▪ Takes the final decision – acceptance/ rejection – of the project proposal and communicates the same to the project proponent
State Government	<ul style="list-style-type: none"> ▪ Identifies experts as per the composition specified in the Notification and subsequent guidelines to recommend to the Central Government. ▪ Extends funding support to fulfill the functions of SEIAA/SEAC ▪ Engages other public agency for conducting public hearings in cases where the SPCB does not respond within time ▪ State Governments will suitably pay the public agency for conducting such activity
EAC	<ul style="list-style-type: none"> ▪ Reviews Form 1 and its attachments ▪ Visits site(s), if necessary ▪ Finalizes ToR and recommends to the Central Government, which in turn communicates the finalized ToR to the project proponent, if not exempted by the Notification ▪ Reviews EIA report, proceedings and appraises their views to the Central government ▪ If the Central Government has any specific views, then the EAC reviews again for appraisal
SEIAA	<ul style="list-style-type: none"> ▪ Receives application from the project proponent ▪ Considers SEAC views for finalization of ToR ▪ Communicates the finalized ToR to the project proponent ▪ Receives EIA report from project proponent ▪ Uploads the summary of EIA report in the website in cases of Category B projects ▪ Forwards the responses received to the project proponent ▪ Receives updated EIA report from project proponent incorporating the considerations from the proceedings of public hearing and responses received through other media ▪ Forwards updated EIA report to SEAC for appraisal ▪ Either accepts the recommendations of SEAC or asks for reconsideration of specific issues for review by SEAC. ▪ Takes the final decision and communicates the same to the project proponent
SEAC	<ul style="list-style-type: none"> ▪ Reviews Form 1 ▪ If necessary visits, site(s) for finalizing the ToR ▪ Reviews updated EIA - EMP report and ▪ Appraises the SEIAA
SPCB	<ul style="list-style-type: none"> ▪ Receives request from project proponent and conducts public hearing in the manner prescribed. ▪ Conveys proceedings to concerned authority and project proponent
Public Agency	<ul style="list-style-type: none"> ▪ Receives request from the respective Governments to conduct public hearing ▪ Conducts public hearing in the manner prescribed. ▪ Conveys proceedings to the concerned Authority/EAC /Project proponent

5.1 SEIAA

- SEIAA is constituted by the MoEF to take final decision regarding the acceptance/rejection of prior environmental clearance to the project proposal for all Category 'B' projects.

- The state government may decide whether to house them at the Department of Environment or at any other Board for effective operational support.
- State Governments can decide whether the positions are permanent or part-time. The Central Government (MoEF) continues to follow the model of paying fee (TA/DA, accommodation, sitting fee) to the Chairperson and the members of EAC. As such, the State Government is to fund SEIAA & SEAC and decide the appropriate institutional support for them.

A. Constitution

- SEIAA is constituted by the Central Government comprising of three members including a Chairperson and Member-Secretary to be nominated by the State Government or UT Administration concerned.
- The Central Government will notify as and when the nominations (in order) are received from the State Governments, within 30 days from the date of receipt.
- The Chairperson and the non-official member shall have a fixed term of three years, from the date of Notification by the Central Government constituting the Authority.

The form used by the State Governments to submit nominations for Notification by the Central Government is provided in **Annexure XIV**.

B. Composition

- Chairperson shall be an expert in the EIA process
- Member Secretary shall be a serving officer of the concerned State Government/ UT Administration familiar with the environmental laws.
- Member Secretary may be of a level equivalent to the Director, Dept. of Environment or above – a full time member.
- All the members including the Chairperson shall be the experts as per the criteria set in the Notification.
- The Government servants can only serve as the Member-Secretary to SEIAA and the Secretary to SEAC. All other members including Chairperson of the SEIAA and SEAC shall not be comprised of serving Government Officers; industry representatives; and activists.
- Serving faculty (academicians) is eligible for the membership in the Authority and/or the Committees, if they fulfill the criteria given in Appendix VI to the Notification.
- This is to clarify that the serving Government officers shall not be nominated as professional/expert member of SEIAA/SEAC/EAC.
- Professionals/Experts in the SEIAA and SEAC shall be different.

Summary regarding the eligibility criteria for Chairperson and Members of the SEIAA is given in Table 5-3.

C. Decision-making process

- The decision of the Authority shall be arrived through consensus.
- If there is no consensus, the Authority may either ask SEAC for reconsideration or may reject the approval.

Stakeholders' Roles and Responsibilities

- All decisions of the SEIAA shall be taken in a meeting and shall ordinarily be unanimous, provided that, in case a decision is taken by majority, the details of views, for and against it, shall be clearly recorded in the minutes and a copy thereof sent to MoEF.

Table 5-3: SEIAA: Eligibility Criteria for Chairperson / Members / Secretary

S. No.	Attribute		Requirement		
			Members	Member Secretary	Chairperson
1	Professional qualification as per the Notification		Compulsory	Compulsory	Compulsory
2	Experience (Fulfilling any one of a, b, c)	a	Professional Qualification + 15 years of experience in one of the expertise area mentioned in the Appendix VI	Professional Qualification + 15 years of experience in one of the expertise area mentioned in the Appendix VI	Professional Qualification + 15 years of experience in one of the expertise area mentioned in the Appendix VI
		b	Professional Qualification +PhD+10 years of experience in one of the expertise area mentioned in Appendix VI	Professional Qualification +PhD+10 years of experience in one of the expertise area mentioned in the Appendix VI	Professional Qualification +PhD+10 years of experience in one of the expertise area mentioned in the Appendix VI
		c	Professional Qualification +10 years of experience in one of the expertise area mentioned in the Appendix VI + 5 years interface with environmental issues, problems and their management	Professional Qualification +10 years of experience in one of the expertise area mentioned in the Appendix VI + 5 years interface with environmental issues, problems and their management	-----
3	Test of independence (conflict of interest) and minimum grade of the Secretary of the Authority		<p>Shall not be a serving government officer</p> <p>Shall not be a person engaged in industry and their associations</p> <p>Shall not be a person associated with environmental activism</p>	<p>Only serving officer from the State Government (DoE) familiar with environmental laws not below the level of Director</p>	<p>Shall not be a serving government officer</p> <p>Shall not be a person engaged in industry and their associations</p> <p>Shall not be a person associated with environmental activism</p>
4	Age		Below 67 years at the time of Notification of the Authority	As per State Government Service Rules	Below 72 Years at the time of the Notification of the Authority
5	Other memberships in Central /State Expert Appraisal committee		Shall not be a member in any SEIAA/EAC/SEAC	Shall not be a member in any SEIAA/EAC/SEAC	Shall not be a member in any SEIAA/EAC/SEAC

Stakeholders' Roles and Responsibilities

S. No.	Attribute	Requirement		
		Members	Member Secretary	Chairperson
6	Tenure of earlier appointment (continuous)	Only one term before this in continuity is permitted	Not applicable	Only one term before this in continuity is permitted
7	Eminent environmental expertise with understanding on environmental aspects and impacts	Desirable	Desirable	Compulsory
8	Expertise in the environmental clearance process	Desirable	Desirable	Compulsory

Note:

1. A member after continuous membership in two terms (6 years) shall not be considered for further continuation. His/her nomination may be considered after a gap of one term (three years), if other criteria meet.
2. Chairperson/Member notified may not be removed prior to the tenure of three years without cause and proper enquiry.

5.2 EAC and SEAC

EAC and SEAC are independent Committees to review each developmental activity and offer its recommendations for consideration of the Central Government and SEIAA respectively.

A. Constitution

- EAC and SEAC shall be constituted by the Central Government comprising a maximum of 15 members including a Chairperson and Secretary. In case of SEAC, the State Government or UT Administration is required to nominate the professionals/experts for consideration and Notification by the Central Government.
- The Central Government will notify as and when the nominations (in order) are received from the State Governments, within 30 days from the date of receipt.
- The Chairperson and the non-official member shall have a fixed term of three years, from the date of Notification by the Central Government.
- The Chairperson shall be an eminent environmental expert with understanding on environmental aspects and environmental impacts. The Secretary of the SEAC shall be a State Government officer, not below the level of a Director/Chief Engineer.
- The members of the SEAC need not be from the same State/UT.
- In case the State Governments/ Union Territories so desire, the MoEF can form regional EAC to serve the concerned States/Union Territories.
- State Governments may decide to their convenience to house SEAC at the Department of Environment or at SPCB or at any other department, to extend support to the SEAC activities.

B. Composition

- Composition of EAC/SEAC as per the Notification is given in **Annexure XV**.
- Secretary to EAC/SEAC may invite a maximum of two professionals/experts with the prior approval of the Chairperson, if desired, for taking the advisory inputs for appraisal. In such case, the invited experts will not take part in the decision making process.
- The Secretary of each EAC/SEAC preferably be an officer of the level equivalent to or above the level of Director, MoEF, GoI.

C. Decision-making

The EAC and SEAC shall function on the principle of collective responsibility. The Chairperson shall endeavour to reach a consensus in each case, and if consensus cannot be reached, the view of the majority shall prevail.

D. Operational issues

- Secretary may deal with all correspondence, formulate agenda and prepare agenda notes. Chairperson and other members may act only for the meetings.
- Chairperson of EAC/SEAC shall be one among the core group having considerable professional experience with proven credentials.
- EAC/SEAC shall meet at least once every month or more frequently, if so needed, to review project proposals and to offer recommendations for the consideration of the Authority.
- EAC/SEAC members may inspect the site at various stages *i.e.*, during screening, scoping and appraisal, as per the need felt and decided by the Chairperson of the Committee.
- The respective Governments through the Secretary of the Committee may pay/reimburse the participation expenses, honorarium *etc.*, to the Chairperson and members.

i) Tenure of EAC/SEIAA/SEAC

The tenure of Authority/Committee(s) shall be for a fixed period of three years. At the end of the three years period, the Authority and the committees need to be re-constituted. However, staggered appointment dates may be adopted to maintain continuity of members at a given point of time.

ii) Qualifying Criteria for Nomination of a Member to EAC/SEIAA/SEAC

While recommending nominations and while notifying the members of the Authority and Expert Committees, it shall be ensured that all the members meet the following three criteria:

- Professional qualification
- Relevant experience/Experience interfacing with environmental management
- Absence of conflict of interest

These are elaborated subsequently.

a) Professional Qualification

The person should have at least

- 5 years of formal University training in the concerned discipline leading to a MA/MSc Degree, or
- In case of Engineering/Technology/Architecture disciplines, 4 years formal training in a professional training course together with prescribed practical training in the field leading to a B.Tech/B.E./B.Arch. Degree, or
- Other professional degree (e.g., Law) involving a total of 5 years of formal University training and prescribed practical training, or
- Prescribed apprenticeship/articleship and pass examinations conducted by the concerned professional association (e.g. MBA/IAS/IFS). In selecting the individual professionals, experience gained by them in their respective fields will be taken note of.

b) Relevant Experience

- Experience shall be related to professional qualification acquired by the person and be related to one or more of the expertise mentioned for the expert members. Such experience should be a minimum of 15 years.
- When the experience mentioned in the foregoing sub-paragraph interfaces with environmental issues, problems and their management, the requirement for the length of the experience can be reduced to a minimum of 10 years.

c) Absence of Conflict of Interest

For the deliberations of the EAC/SEAC to be independent and unbiased, all possibilities of potential conflict of interests have to be eliminated. Therefore, serving government officers; persons engaged in industry and their associations; persons associated with the formulation of development projects requiring environmental clearance, and persons associated with environmental activism shall not be considered for membership of SEIAA/ SEAC/ EAC.

iii) Age

Below 70 years for the members and below 72 years for the Chairperson of the SEIAA/SEAC/EAC. The applicability of the age is at the time of the Notification of the SEIAA/SEAC/EAC by the Central Government.

Summary regarding the eligibility criteria for Chairperson and Members of the EAC/ SEAC are given in Table 5-4.

Table 5-4: EAC/SEAC: Eligibility Criteria for Chairperson / Members / Secretary

3	Test of independence (conflict of interest) and minimum grade of the Secretary of the Committees	<p>Shall not be a serving government officer</p> <p>Shall not be a person engaged in industry and their associations</p> <p>Shall not be a person associated with environmental activism</p>	<p>In case of EAC, not less than a Director from the MoEF, Government of India</p> <p>In case of SEAC, not below the level of Director/Chief Engineer from the State Government (DoE)</p>	<p>Shall not be a serving government officer</p> <p>Shall not be a person engaged in industry and their associations</p> <p>Shall not be a person associated with environmental activism</p>	
4	Age	Below 67 years at the time of Notification of the Committee	As per state Government Service Rules	Below 72 Years at the time of the Notification of the Committee	
5	Membership in Central/State Expert Appraisal committees	Only one other than this nomination is permitted	Shall not be a member in other SEIAA/EAC/SEAC	Shall not be a member in any other SEIAA/EAC/SEAC	
6	Tenure of earlier appointment (continuous)	Only one term before this in continuity is permitted	Not applicable	Only one term before this in continuity is permitted	
7	Eminent environmental expertise with understanding on environmental aspects and impacts	Desirable	Not applicable	Compulsory	

Note:

Stakeholders' Roles and Responsibilities

1. A member after continuous membership in two terms (six years) shall not be considered for further continuation. His/her nomination may be reconsidered after a gap of one term (three years), if other criteria meet.

2. Chairperson/Member notified may not be removed prior to the tenure of 3 years with out cause and proper enquiry. A member after continuous membership in two terms (6 years) shall not be considered for further continuation. The same profile may be considered for nomination after a gap of three years, i.e., one term, if other criteria are meeting.

E. Other Conditions

- An expert member of one State/UT, can have at the most another State/UT Committee membership, but in no case more than two Committees at a given point of time.
- An expert member of a Committee shall not have membership continuously in the same committee for more than two terms, i.e., six years. They can be nominated after a gap of three years, i.e., one term. When a member of Committee has been associated with any development project, which comes for environmental clearance, he/she may not participate in the deliberations and the decisions in respect to that particular project.
- At least four members shall be present in each meeting to fulfill the quorum.
- If a member does not consecutively attend six meetings, without prior intimation to the Committee his/her membership may be terminated by the Notifying Authority. Prior information for absence due to academic pursuits, career development and national/state-endorsed programmes may be considered as genuine grounds for retention of membership.

ANNEXURE I
Mercury Emission Status and Control Technology

Mercury Emission Status & Control Technology

A growing concern in India is the release of various toxic trace elements such as mercury (Hg), arsenic (As), lead (Pb), cadmium (Cd), etc., from power plants through the disposal and dispersal of coal ash. Among the various toxic elements mercury emissions from coal based TPP are of particular concern, mercury emitted in flue gases or in flyash/bottom-ash that is disposed off in ash ponds enters the hydrological system, wherein the mercury can be methylated. Then this methyl-mercury can then enter the human food chain, mainly through consumption of fish (Shah et al., 2008). Thus this food chain exposure pathway to mercury at high levels can harm the brain, heart, kidneys, lungs, and immune system of people of all ages.

Mercury can be emitted in three different forms: elemental (Hg₀), oxidized (Hg₂₊) and particle bound (HgP). Upon combustion, coal flyash tends to have a higher concentration of mercury, and estimates indicate that Indian coal ash has an average mercury concentration of 0.53 mg/kg, based on measurements from a few selected power plants.

Besides Indian coal is very high in mercury contents and the following table reflect the concentrations of many trace elements in Indian as well as other typical comparable sources. The levels in Indian coal are high in comparison to other countries.

Element	Earth's Crust Average	Indian Minimum	Indian Maximum	Indian Average	British Average	US Average	Australian Average	Worldwide Average
As	2.0	0.1	23.0	5.0	18	15	3	5
Hg	0.1	0.0	2.7	0.35	--	0.18	0.1	0.012
Cd	0.15	0.0	13.0	1.3	0.4	1.3	0.1	-
Pb	16.0	0.0	46.5	15.0	38	16	10	25
Cr	200.0	5.0	90.8	70.0	33.6	15	6	10
Ni	80.0	0.0	100.0	45.0	27.9	15	15	15
Co	23.0	2.1	40.0	11.0	--	7	-	5

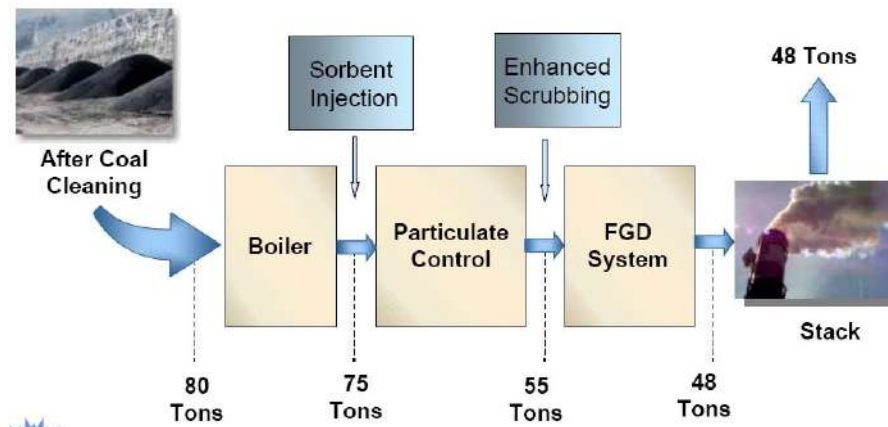

Table: Concentration (mg/kg) of trace elements in Indian coal and lignite, compared to other coals.

Source: (Masto et al., 2007).

Mercury contained in fuel evaporates during fuel combustion in boilers operating at temperatures above 1100 C. Some of the gas may cool and condense as it passes through the boiler and the air pollution control system. The recent measurements at an NTPC 500 MW power plant indicated that the concentration of mercury in the stack flue gas was about 2.8 +/- 0.5 µg/m³ (Jain and Roy, 1999).

Example of Mercury Balance

Currently, there is no NAAQS for mercury, although there are consent condition necessitating monitoring of ambient and emission Hg for Greenfield TPP. Although there are no limits set at this stage for mercury emissions from power plants, there are some general guidelines available for mercury in power plant effluents.

Control Technology for Mercury Emissions

The most of mercury emissions generated during the combustion process need to be controlled by devices added on the TPP installations to remove particles and acidic gases. The most commonly used devices to remove particles from exhaust gases in electric power plants and large industrial boilers are electrostatic precipitators (ESPs) and fabric filters (FFs). Various types of flue gas desulfurization (FGDs) are in use to control sulfur dioxide emissions in some TPP plants.

Recent literature review of data from various power plants in the United States concluded that ESPs have a median mercury removal efficiency of 32% (U.S.EPA, 1997). It was also concluded that FFs are more efficient in removing mercury from the flue gas stream in power plants as part of the mercury may adsorb onto the fly ash cake collected on FFs. It was estimated that FFs have a median mercury removal efficiency of 42 (U.S. EPA, 1997). The USEPA data indicate that currently installed control devices, particularly combined systems of ESP or FFs with FGDs or SDAs can remove over 50 % of mercury from flue gases leaving the utility and also other major industrial boilers.

Fuel washing and fuel substitution are the major pre-treatment measures to reduce emissions of various pollutants from coal combustion processes, including reduction of mercury. The cleaning of coal takes place in water, in a dense medium, or in a dry medium. Physical cleaning processes are based on either the specific gravity or surface property differences between the coal and its impurities. Jigs, concentrating tables, hydrocyclones, and froth flotation cells are common devices used in current physical coal-cleaning facilities. The removal efficiency as observed in USA ranged from 0 to 60 % with 21 % as average reduction. This efficiency is highly dependent on the type of coal and chloride content of the coal. Control of mercury emissions has so far not been on the forefront of pollution reduction from coal power plants in India, however, greater use of washed coals and pollution control devices in India would already help in reducing mercury emissions. Hence, there are several different options for reducing mercury emissions from power plants which are:

- Selective mining of low-mercury coals, 173
- Coal washing/beneficiation – this depends on coal characteristics, but about 30-80% of mercury can be reduced by proper washing,
- Fluidized bed combustion, especially for high chlorine coals,
- Use of pollution control devices such as low-NO_x burners, cold-side ESPs, bag-filters, FGD, and SCR, are also effective and
- Sorbent injection into flue gas ducts – typically, activated carbon can be injected either upstream or downstream of the ESP.

Control during Pre-treatment

Fuel washing and fuel substitution are the major pre-treatment measures to reduce emissions of various pollutants from coal combustion processes, including reduction of mercury.

Commercial coal cleaning (or beneficiation)

Commercial coal cleaning (or beneficiation) facilities are physical cleaning techniques to reduce the mineral matter and pyretic sulfur content. As a result, the product coal has a higher energy density and less variability (compared to feedstock coal) so that power plant efficiency and reliability are improved. A side benefit to these processes is that emissions of sulfur dioxide, as well as other pollutants including mercury can be reduced. The efficiency of this removal depends on the cleaning process used, type of coal, and the contaminant content of coal. Basic physical coal cleaning techniques have been commercial for over 50 years. The cleaning of coal takes place in water, in a dense medium, or in a dry medium.

Physical cleaning processes are based on either the specific gravity or surface property differences between the coal and its impurities. Jigs, concentrating tables, hydro-cyclones, and froth flotation cells are common devices used in current physical coal-cleaning facilities.

The removal efficiency ranged from 0 to 60 % with 21 % as average reduction. This efficiency is highly dependent on the type of coal and chloride content of the coal. Concerning other fuels, the cleaning of crude oil occurs mostly through the residue desulfurization (RDS). However, the content of Hg in crude oil is usually very low and RDS is an inefficient method to even lower this content.

Fuel Switching

The following options of fuel substitution are often considered in the electric utilities: switching from high- to low-sulfur coal burnt in applicable coal-based generation (including switching directly from high-sulfur to low-sulfur supplies, blending high- and low-sulfur coal, cleaning high- and medium-sulfur coal, or a combination of cleaning and blending), increasing the use of natural gas, or oil, and increasing the use of alternate fuels or importing electricity to meet base load electric generation requirements. The two latter methods are the most interesting with respect to the reduction of mercury emissions. The substitution of coal by coal bed methane to produce heat and electricity would result in decrease of emissions of various air pollutants, including mercury. But, the following action would be needed in the case of the substitution:

- the modernization of existing utility and industrial heat producing plants,
- the development of new methane burning boilers, and
- the modernization of coal mines with respect to the better exploitation of coal bed methane.

Non-conventional methods of Hg Removal

Non-conventional methods of combustion, such as fluidized bed combustion (FBC) were found to generate comparable or slightly lower emissions of mercury and other trace elements compared to the conventional power plants.

However, a long residence time of the bed material may result in increased fine particle production and thus more efficient condensation of gaseous mercury. Tests carried out in the Germany have shown that the residence time of the bed material can be regulated by

changing the operating conditions of a given plant, the reduction of combustion temperature, coal size, moisture content, and bed flow rates.

Secondary measures include technological solutions to decrease concentrations of pollutants in the flue gas. Major emphasis in this report is placed on the removal of mercury and its compounds by the application of flue gas desulfurization (FGD).

Low NO_x technologies are also likely to reduce mercury emission in the exhaust gases due to the lower operating temperatures. Very limited information on this subject is rather inconclusive. While some sources indicate that the reduction can be achieved, preliminary results of staged combustion in atmospheric fluidized bed combustion (AFBC) units indicated that low NO_x had only little effect on trace element emissions (Smith, 1987). It should be noted, however, that low NO_x technologies are far less used compared to the FGD systems.

ANNEXURE II
A Compilation of Legal Instruments

SL. NO.	LEGAL INSTRUMENT (TYPE, REFERENCE, YEAR)	RESPONSIBLE MINISTRIES OR BODIES	CHEMICAL USE CATEGORIES/POLLUTANTS	OBJECTIVE OF LEGISLATION	RELEVANT ARTICLES/PROVISIONS
1	Air (Prevention and Control of Pollution) Act, 1981 amended 1987	Central Pollution Control Board and State Pollution Control Boards	Air pollutants from chemical industries	The prevention, control and abatement of air pollution	Section 2: Definitions Section 21: Consent from State Boards Section 22: Not to allow emissions exceeding prescribed limits Section 24: Power of Entry and Inspection Section 25: Power to Obtain Information Section 26: Power to Take Samples Section 37-43: Penalties and Procedures

ANNEXURE III
General Standards for Discharge of Environmental Pollutants

Table: Water Quality Standards

S. No.	Parameter	Standards			
		Inland Surface Water	Public Sewer	Land for Irrigation	Marine Coastal Areas
1.	2.	3.			
		(a)	(b)	(c)	(d)
1.	Colour and odour	See Note-1	—	See Note-1	See Note-1
2.	Suspended Solids, mg/l, Max	100	600	200	(a) For process waste water-100 (b) For cooling water effluent-10 per cent above total suspended matter of influent cooling water.
3.	Particle size of suspended solids	Shall pass 850 micron IS Sieve	—	—	(a) Floatable solids, Max 3 mm (b) Settleable solids Max 850 microns.
4.	Dissolved solids (inorganic), mg/a, mac	2100	2100	2100	—
5.	pH value	5.5 to 9.0	5.5 to 9.0	5.5 to 9.0	5.5 to 9.0
6.	Temperature °C, Max	Shall not exceed 40 in any section of the stream within 15 meters down stream from the effluent outlet	45 at the point of discharge	—	45 at the point of discharge
7.	Oil and grease, mg/l, max	10	20	10	20
8.	Total residual chlorine, mg/l, Max.	1.0	—	—	1.0
9.	Ammonical nitrogen (as N), mg/l, Max.	50	50	—	50
10.	Total Kjeldahl nitrogen (as N), mg/l, Max.	100	—	—	100
11.	Free Ammonia (as NH ₃), mg/l, Max.	5.0	—	—	5.0
12.	Biochemical Oxygen Demand (5 days at 20°C) Max.	30	350	100	100
13.	Chemical Oxygen Demand, mg/l, Max.	250	—	—	250
14.	Arsenic (as As), mg/l, Max.	0.2	0.2	0.2	0.2
15.	Mercury (as Hg), mg/l, Max.	0.01	0.01	—	0.01
16.	Lead (as Pb), mg/l, Max.	0.1	1.0	—	1.0
17.	Cadmium (as Cd), mg/l, Max.	2.0	1.0	—	2.0

18.	Hexavalent chromium (as Cr+6) mg/l, Max.	0.1	2.0	—	1.0
19.	Total chromium as (Cr), mg/l, Max.	2.0	2.0	—	2.0
20.	Copper (as Cu), mg/l, Max.	3.0	3.0	—	3.0
21.	Zinc (as Zn), mg/l, Max.	5.0	15	—	15
22.	Selenium (as Se), mg/l, Max.	0.05	0.05	—	0.05
23.	Nickel (as Ni), mg/l, Max.	3.0	3.0	—	5.0
24.	Boron (as B), mg/l, Max.	2.0	2.0	2.0	—
25.	Percent Sodium, Max.	—	60	60	—
26.	Residual sodium carbonate, mg/l, Max.	—	—	5.0	—
27.	Cyanide (as CN), mg/l, Max.	0.2	2.0	0.2	0.2
28.	Chloride (as Cl), mg/l, Max.	1000	1000	600	(a)
29.	Fluoride (as F), mg/l, Max.	2.0	15	—	15
30.	Dissolved Phosphates (as P), mg/l, Max.	5.0	—	—	—
31.	Sulphate (as SO ₄), mg/l, Max.	1000	1000	1000	—
32.	Sulphide (as S), mg/l, Max.	2.0	—	—	5.0
33.	Pesticides	Absent	Absent	Absent	Absent
34.	Phenolic compounds (as C ₆ H ₅ OH), mg/l, Max.	1.0	5.0	—	5.0
35.	Radioactive materials				
	(a) Alpha emitters MC/ml, Max.	10 ⁻⁷	10 ⁻⁷	10 ⁻⁸	10 ⁻⁷
	(b) Beta emitters uc/ml, Max.	10 ⁻⁶	10 ⁻⁶	10 ⁻⁷	10 ⁻⁶

Note :-

1. All efforts should be made to remove colour and unpleasant odour as far as practicable.
2. The standards mentioned in this notification shall apply to all the effluents discharged such as industrial mining and mineral processing activities municipal sewage etc.

Table: Noise Standards

Ambient air quality standards in respect of noise

Area Code	Category of Area	Limits in dB (A) Leq	
		Day Time	Night Time
(A)	Industrial area	75	70
(B)	Commercial area	65	55
(C)	Residential area	55	45
(D)	Silence zone	50	40

Note :

1. Day time is reckoned in between 6.00 AM and 9.00 PM
2. Night time is reckoned in between 9.00 PM and 6.00 AM
3. Silence zone is defined as areas upto 100 meters around such premises as hospitals, educational institutions and courts. The Silence zones are to be declared by the Competent Authority.
4. Use of vehicular horns, loudspeakers and bursting of crackers shall be banned in these zones.
5. Mixed categories of areas should be declared as one of the four above mentioned categories by the Competent Authority and the corresponding standards shall apply.

Standards/Guidelines for Control of Noise Pollution from Stationary Diesel Generator (DG) Sets

(A) Noise Standards for DG Sets (15-500 KVA)

The total sound power level, L_w , of a DG set should be less than, $94+10 \log_{10} (KVA)$, dB (A), at the manufacturing stage, where, KVA is the nominal power rating of a DG set.

This level should fall by 5 dB (A) every five years, till 2007, i.e. in 2002 and then in 2007.

(B) Mandatory acoustic enclosure/acoustic treatment of room for stationary DG sets (5 KVA and above)

Noise from the DG set should be controlled by providing an acoustic enclosure or by treating the room acoustically.

The acoustic enclosure/acoustic treatment of the room should be designed for minimum 25 dB(A) Insertion Loss or for meeting the ambient noise standards, whichever is on the higher side (if the actual ambient noise is on the higher side, it may not be possible to check the performance of the acoustic enclosure/acoustic treatment. Under such circumstances the performance may be checked for noise reduction upto actual ambient noise level, preferably, in the night time). The measurement for Insertion Loss may be done at different points at 0.5m from the acoustic enclosure/room, and then averaged.

The DG set should also be provide with proper exhaust muffler with Insertion Loss of minimum 25 dB(A).

(C) Guidelines for the manufacturers/users of DG sets (5 KVA and above)

1. The manufacturer should offer to the user a standard acoustic enclosure of 25 dB(A) Insertion Loss and also a suitable exhaust muffler with Insertion Loss of 25 dB(A).

2. The user should make efforts to bring down the noise levels due to the DG set, outside his premises, within the ambient noise requirements by proper siting and control measures.
3. The manufacturer should furnish noise power levels of the unlicensed DG sets as per standards prescribed under (A)
4. The total sound power level of a DG set, at the user's end, shall be within 2 dB(A) of the total sound power level of the DG set, at the manufacturing stage, as prescribed under (A).
5. Installation of a DG set must be strictly in compliance with the recommendation of the DG set manufacturer.
6. A proper routine and preventive maintenance procedure for the DG set should be set and followed in consultation with the DG set manufacturer which would help prevent noise levels of the DG set from deteriorating with use.

Order of the Lt. Governor of Delhi in respect of D.G. Sets (5th December, 2001)

In exercise of the powers conferred by section 5 of the Environment (Protection) Act, 1986, (29 of 1986), read with the Government of India, Ministry of Home Affairs notification S.O. 667 (E) bearing No. F.No. U-11030/J/91-VTL dated 10th September, 1992, the Lt. Governor of Government of National Capital of Delhi hereby directs to all owners/users of generators sets in the National Capital Territory of Delhi as follows :-

1. that generator sets above the capacity of 5 KVA shall not be operated in residential areas between the hours of 10.00 PM to 6.00 AM;
2. that the generator sets above the capacity of 5 KVA in all areas residential/commercial/industrial shall operate only with the mandatory acoustic enclosures and other standards prescribed in the Environment (Protection) Rules, 1986;
3. that mobile generator sets used in social gatherings and public functions shall be permitted only if they have installed mandatory acoustic enclosures and adhere to the prescribed standards for noise and emission as laid down in the Environment (Protection) Rules, 1986.

The contravention of the above directions shall make the offender liable for prosecution under section 15 of the said Act which stipulates punishment of imprisonment for a term which may extend to five years with fine which may extend to one lakh rupees, or with both, and in case the failure of contravention continues, with additional fine which may extend to five thousand rupees for every day during which such failure or contravention continues after the conviction for the first such failure or contravention and if still the failure or contravention continues beyond a period of one year after the date of contravention, the offender continues beyond a period of one year after the date of contravention, the offender shall be punishable with imprisonment for a term which may extend to seven years.

Order Dated: 21st June, 2002

In exercise of the powers conferred by section 5 of the Environment (Protection) Act, 1986 (29 of 1986) read with the Govt. of India, Ministry of Home Affairs notification S.O. 667(E) bearing No. U-11030/J/91-VTL dated the 10th September, 1992, the Lt. Governor Govt. of the National Capital Territory of Delhi hereby makes the following amendment/modification in his order dated the 5th December, 2001 regarding the operation of generator sets, namely:-

Amendments/modifications

In the above said order, for clause(1), the following shall be substituted, namely:-

“(1) that the generator sets above 5KVA shall not be operated in residential areas between the hours from 10.00 p.m. to 6.00 a.m. except generator sets of Group Housing Societies and Multi-storey residential apartments”.

DIESEL GENERATOR SETS: STACK HEIGHT

The minimum height of stack to be provided with each generator set can be worked out using the following formula:

$$H = h + 0.2 \times \text{OKVA}$$

H = Total height of stack in metre

h = Height of the building in metres where the generator set is installed

KVA = Total generator capacity of the set in KVA

Based on the above formula the minimum stack height to be provided with different range of generator sets may be categorized as follows:

For Generator Sets	Total Height of stack in metre
50 KVA	Ht. of the building + 1.5 metre
50-100 KVA	Ht. of the building + 2.0 metre
100- 150 KVA	Ht. of the building + 2.5 metre
150-200 KVA	Ht. of the building + 3.0 metre
200-250 KVA	Ht. of the building + 3.5 metre
250-300 KVA	Ht. of the building + 3.5 metre

Similarly for higher KVA ratings a stack height can be worked out using the above formula

ANNEXURE IV
Environmental Standards for Liquid Effluents from Thermal
Power Plants

Environmental Standards

Thermal Power Plant: Standards for Liquid Effluents

Source	Parameter	Concentration not to exceed, mg/l (except for pH & Temp.)
Condenser Cooling Water (once through higher cooling system)	pH	6.5 to 8.5
	Temperature*	Not more than 5°C than the higher intake
Boiler Blowdown	Free available Chlorine	0.5
	Suspended solids	100
	Oil & grease	20
	Copper (Total)	1.0
	Iron (Total)	1.0
Cooling Tower Blowdown	Free available Chlorine	
	Zinc	1.0
	Chromium (Total)	0.2
	Phosphate	5.0
	Other corrosion inhibiting material	Limit to be established on case by case basis by Central Board in case of Union Territories and State Boards in case of States
As pond effluent	pH	6.5 to 8.5
	Suspended solids	100
	Oil & grease	20

* Limit has been revised, please see new limit at Sr. No. 66C of the document

Thermal Power Plant: Emission Standards

Generation Capacity	Pollutant	Emission limit
210 MW or more	Particulate matter	150 mg/Nm ³
Less than 210 MW	Particulate matter	300 mg/Nm ³

* Depending upon the requirement of local situation, such as protected area, the State Pollution Control Boards and other implementing agencies under the Environment (Protection) Act, 1986, may prescribe a limit of 150 mg/Nm³, irrespective of generation capacity of the plant.

Thermal Power Plants: Stack Height/Limits

Generation Capacity	Stack Height (Metres)
500 MW and above	275
200 MW/210 MW and above to less than 500 MW	220
Less than 200 MW/210 MW	H= 14 Q ^{0.3} where Q is emission rate of SO ₂ in kg/hr, and H is Stack height in metres.

G.S.R. 742(E), dt. 30th Aug; 1990

TEMPERATURE LIMIT FOR DISCHARGE OF CONDENSER COOLING WATER FROM THERMAL POWER PLANT

A. New thermal power plants commissioned after June 1, 1999.

New thermal power plants, which will be using water from rivers/lakes/reservoirs, shall install cooling towers irrespective of location and capacity. Thermal power plants which will use sea water for cooling purposes, the condition below will apply.

B. New projects in coastal areas using sea water.

The thermal power plants using sea water should adopt suitable system to reduce water temperature at the final discharge point so that the resultant rise in the temperature of receiving water does not exceed 7°C over and above the ambient temperature of the receiving water bodies.

C. Existing thermal power plants.

Rise in temperature of condenser cooling water from inlet to the outlet of condenser shall not be more than 10°C.

D. D. Guidelines for discharge point.

1. The discharge point shall preferably be located at the bottom of the water body at mid stream for proper dispersion of thermal discharge.
2. In case of discharge of cooling water into sea, proper marine outfall shall be designed to achieve the prescribed standards the point of discharge may be selected in consultation with concerned State Authorities/ NIO.
3. No cooling water discharge shall be permitted in estuaries or near ecologically sensitive areas such as mangroves, coral reefs/ spawning and breeding grounds of aquatic flora and fauna

ANNEXURE V
Utilization of Ash by Thermal Power Plants

THE GAZETTE OF INDIA

EXTRAORDINARY

PART II – Section 3 -- Sub-section (ii)

MINISTRY OF ENVIRONMENT AND FORESTS

NOTIFICATION

New Delhi, the 14th September, 1999

S.O.763(E).- Whereas a draft notification containing certain directions was published, as required by subrule (3) of rule 5 of the Environment (Protection) Rules, 1986 under the notification of the Government of India in the Ministry of Environment and Forests number S.O. 453(E) dated 22nd May, 1998 inviting objections and suggestions from all persons likely to be affected thereby, before the expiry of the period of sixty days from the date on which the copies of the Gazette of India containing the said notification are made available to the public;

And, whereas, copies of the said Gazette were made available to the public on the same date;

And, whereas, the objections and suggestions received from the public in respect of the said draft notification have been duly considered by the Central Government;

Where as it is necessary to protect the environment, conserve top soil and prevent the dumping and disposal of fly ash discharged from coal or lignite based thermal power plants on land;

And, whereas, there is a need for restricting the excavation of top soil for manufacture of bricks and promoting the utilisation of fly ash in the manufacture of building materials and in construction activity within a specified radius of fifty kilometers from coal or lignite based thermal power plants;

And, Whereas, the Hon'ble High Court of Judicature, Delhi vide its order dated 25th August, 1999 in CWP No. 2145/99 Centre for Public Interest Litigation, Delhi v/s Union of India directed that the Central Government to publish the final notification in respect of fly ash on or before 26th October, 1999;

Now, therefore, in exercise of the powers conferred by sub-section (1), read with clause (v) of sub-section (2) of section 3 and section 5 of the Environment (Protection) Act, 1986 (29 of 1986); and in pursuance of the orders of the Hon'ble High Court, Delhi stated above, the Central Government hereby issues the following directions which shall come into force on the date of the publication of this notification, namely:-

1. Use of fly ash, bottom ash or pond ash in the manufacture of bricks and other construction activities.-

(1) No person shall within a radius of fifty kilometers from coal or lignite based thermal power plants, manufacture clay bricks or tiles or blocks for use in construction activities without mixing at least 25 per cent of ash (fly ash, bottom ash or pond ash) with soil on weight to weight basis.'

(2) The authority for ensuring the use of specified quantity of ash as per para (1) above shall be the concerned Regional Officer of the State Pollution Control Board or the Pollution Control Committee as the case may be. In case of non-compliance, the said authority, in addition to cancellation of consent order issued to establish the brick kiln, shall move the district administration for cancellation of mining lease. The cancellation of mining lease shall be decided after due hearing. To enable the said authority to verify the actual use of ash, the thermal power plant shall maintain month-wise records of ash made available to each brick kiln.

(3) In case of non-availability of ash from thermal power plant in sufficient quantities as certified by the said power plant, the stipulation under para (1) shall be suitably modified (waived/ relaxed) by the concerned State/Union Territory Government.

(4) Each coal or lignite based thermal power plant shall constitute a dispute settlement committee which shall include the General Manager of the thermal power plant and a representative of All India Brick and Tile Manufacture's Federation (AIBTMF). Such a committee shall ensure unhindered loading and transport of ash without any undue loss of time. Any unresolved dispute shall be dealt with by a State/Union Territory level committee to be set up by State/Union Territory Government comprising Member Secretary of the State Pollution Control Board/Pollution Control Committee, representatives of Ministry of Power in the State/Union Territory Government and a representative of AIBTMF.

2. Utilisation of ash by Thermal Power Plants.

All coal or lignite based thermal power plants shall utilise the ash generated in the power plants as follows: -

(1) Every coal or lignite based thermal power plant shall make available ash, for at least ten years from the date of publication of this notification, without any payment or any other consideration, for the purpose of manufacturing ash-based products such as cement, concrete blocks, bricks, panels or any other material or for construction of roads, embankments, dams, dykes or for any other construction activity.

(2) Every coal or lignite based thermal power plant commissioned subject to environmental clearance conditions stipulating the submission of an action plan for full utilisation of fly ash shall, within a period of nine years from the publication of this notification, phase out the dumping and disposal of fly ash on land in accordance with the plan. Such an action plan shall provide for thirty per cent of the fly ash utilisation, within three years from the publication of this notification with further increase in utilisation by atleast ten per cent points every year progressively for the next six years to enable utilisation of the entire fly ash generated in the power plant atleast by the end of ninth year. Progress in this regard shall be reviewed after five years.

(3) Every coal or lignite based thermal power plant not covered by para (2) above shall, within a period of fifteen years from the date of publication of this notification, phase out the utilisation of fly ash in accordance with an action plan to be drawn up by the power plants. Such action plan shall provide for twenty per cent of fly ash utilisation within three years from the date of publication of this notification, with further increase in utilisation every year progressively for the next twelve years to enable utilisation of the entire fly ash generated in the power plant.

(4) All action plans prepared by coal or lignite based thermal power plants in accordance with sub-para (2) and (3) of para 2 of this notification, shall be submitted to the Central Pollution Control Board/Committee and concerned, State Pollution Control Board/Committee and concerned regional office of the Ministry of Environment and Forests within a period of six months from the date of publication of this notification.

(5) The Central and State Government Agencies, the State Electricity Boards, the National Thermal Power Corporation and the management of the thermal power plants shall facilitate in making available land, electricity and water for manufacturing activities and provide access to the ash lifting area for promoting and setting up of ash-based production units in the proximity of the area where ash is generated by the power plant.

(6) Annual implementation report providing information about the compliance of provisions in this notification shall be submitted by the 30th day of April every year to the Central Pollution Control Board, concerned State Pollution Control Board/Committee and the concerned Regional Office of the Ministry of Environment and Forests by the coal or lignite based thermal power plants.

3. Specifications for use of ash-based products.-

(1) Manufacture of ash-based products such as cement, concrete blocks, bricks, panels or any other material or the use of ash in construction activity such as in road laying, embankments or use as

landfill to reclaim low lying areas including back filling in abandoned mines or pitheads or for any other use shall be carried out in accordance with specifications and guidelines laid down by the Bureau of Indian Standards, Indian Bureau of Mines, Indian Road Congress, Central Building Research institute, Roorkee, Central Road Research Institute, New Delhi, Building Materials and Technology Promotion Council, New Delhi, Central Public Works Department, State Public Works Departments and other Central and State Government agencies.

(2) The Central Public Works Department, Public Works Departments in the State/Union Territory Governments, Development Authorities, Housing Boards, National Highway Authority of India and other construction agencies including those in the private sector shall also prescribe the use of ash and ash-based products in their respective schedules of specifications and construction applications, including appropriate standards and codes of practice, within a period of four months from the publication of this notification.

(3) All local authorities shall specify in their respective building bye-laws and regulations the use of ash and ash-based products and construction techniques in building materials, roads, embankments or for any other use within a period of four months from the date of publication of this notification.

[F. No. 16-2/95-HSMD]

V RAJAGOPALAN, Jt.. Secy.

MINISTRY OF ENVIRONMENT AND FORESTS

NOTIFICATION

New Delhi, the 27th August 2003.

S.O. 979 (E):- Whereas a draft of certain amendments to the Government of India in the Ministry of Environment and Forests notification number S.O.763 (E) dated 14th September, 1999 (hereinafter referred to as the said notification) which the Central Government proposes to make under sub-section (1) and clause (v) of sub-section (2) of section 3 of the Environment (Protection) Act, 1986 (29 of 1986) read with clause (d) of sub-rule (3) of rule 5 of the Environment (Protection) Rules, 1986, were published in the Gazette of India, Extraordinary, Part II, Section 3, Sub-section (ii) dated the 6th November, 2002 *vide* S.O. 1164 (E), dated the 5th November, 2002 inviting objections and suggestions from all persons likely to be affected thereby before the expiry of sixty days from the date on which copies of the Gazette containing the said draft amendments were made available to the public.

And, whereas copies of the said Gazette were made available to the public on 27th November 2002;

And, whereas all the objections and suggestions received from all persons likely to be affected thereby in respect of the said draft notification have been duly considered by the Central Government;

Now, therefore, in exercise of the powers conferred by sub-section (1) and clause (v) of sub-section (2) of section 3 of the Environment (Protection) Act, 1986 (29 of 1986) read with clause (d) of sub-rule (3) of rule 5 of the Environment (Protection) Rules, 1986, the Central Government hereby makes the following amendments to the said notification, namely: -

AMENDMENTS

1. In the said notification, in the preamble, for the words "fifty kilometers", the words "one hundred kilometres" shall be substituted.
2. In the said notification, in paragraph 1, -
 - (a) in sub-paragraph (1), for the words "fifty kilometers", the words "one hundred kilometres" shall be substituted;
 - (b) after sub-paragraph (1), the following sub- paragraphs shall be inserted, namely: -

"(1A) Every construction agency engaged in the construction of buildings within a radius of fifty to one hundred kilometres from a coal or lignite based thermal power plant shall use fly ash bricks or blocks or tiles or clay fly ash bricks or cement fly ash bricks or blocks or similar products or a combination or aggregate of them in such construction as per the following minimum percentage (by volume) of the total bricks, blocks and tiles, as the case may be, used in each construction project, namely:-

(i) 25 per cent by 31st August 2004;

(ii) 50 per cent by 31st August 2005;

(iii) 75 per cent by 31st August, 2006; and

(iv) 100 per cent by 31st August 2007.

In respect of construction of buildings within a radius of 50 kilometres from a coal or lignite based thermal power plant the following minimum per centage (by volume) of use of bricks, blocks and tiles shall apply: -

(i) 50 per cent by 31st August 2004;

(ii) 100 per cent by 31st August 2005.

(1B) The provisions of sub-paragraph (1A) shall be applicable to all construction agencies such as Housing Boards and those in the private sector builders of apartments, hotels, resorts and cottages and the like. It shall be the responsibility of the construction agencies either undertaking the construction or approving the design or both to ensure compliance of the provisions of sub-paragraph (1A) and to submit such returns as may be called for and compliance reports to the State Government or Union territory Administration”;

(c) for sub-paragraph (2), the following sub-paragraphs shall be substituted, namely: -

“(2) The authority for ensuring the use of specified quantity of ash as per sub-paragraph (1) shall be the concerned Regional Officer of the State Pollution Control Board or the Pollution Control Committee, as the case may be.

(2A) The concerned State Government shall be the enforcing and monitoring authority for ensuring compliance of the provisions of sub-paragraph (IA).”;

(d) in sub-paragraph (3), for the words, brackets and figure “under para (1)” the words, brackets and figure “under sub-paragraph (1)” shall be substituted;

(e) after sub-paragraph (3), the following sub-paragraphs shall be inserted, namely: -

“(3A) A decision on the application for manufacture of fly ash bricks, block, and tiles and similar other fly ash based products shall be taken within thirty days from the date of receipt of the application by the competent authority. A decision on consent to establish the brick kiln shall be taken by the Pollution Control Board or the Pollution Control Committee, as the case may be, within a period of thirty days from the date of receipt of application by it.

(3B) In case of non-compliance of the provisions of sub-paragraph (1) of paragraph 1, the competent authority, in addition to cancellation of consent order issued to establish the brick kiln, shall move the district administration for cancellation of the mining lease.

(3C) All authorities sanctioning or renewing any land, soil or clay mining lease shall not grant such lease or extension of lease or renewal to clay brick, block or tile manufacturing unit within a radius of

one hundred kilometres of the coal or lignite based thermal power plant in cases where the manufacturer does not mix a minimum of 25 per cent by weight of fly ash or pond ash in the manufacture of bricks or blocks or tiles. The cancellation of mining lease shall be decided by the district administration after giving the holder of such lease an opportunity of being heard. To enable the competent authority to verify the actual use of ash, the thermal power plant shall maintain month-wise records of ash made available to each brick kiln.

(3 D) It shall be sufficient compliance of this notification if within twelve months from the date of issue of this notification, manufacturers of clay bricks, blocks and tiles located within a radius of 50 to 100 kilometres of a coal or lignite based thermal power plant comply with the provisions of sub-paragraphs (1) and (2).”.

(f) in sub-paragraph (4), after brackets and letters “(AIBTMF)”, the words “or a representative of local brick kiln owners association, federation, group.” shall be inserted;

(g) after sub-paragraph (4), the following sub-paragraphs shall be inserted, namely: -

“(5) No agency, person or organization shall, within a radius of 100 kilometres of a thermal power plant undertake construction or approve design for construction of roads or flyover embankments in contravention of the guidelines/ specifications issued by the Indian Road Congress (IRC) as contained in IRC specification No. SP: 58 of 2001. Any deviation from this direction can only be agreed to on technical reasons if the same is approved by Chief Engineer (Design) or Engineer-in-Chief of the concerned agency or organization or on production of a certificate of “Pond ash not available” from the thermal power plant(s) (TPPs) located within 100 kilometres of the site of

construction. This certificate shall be provided by the TPP within two working days from the date of making a request for ash.

(6) Soil required for top or side covers of embankments of roads or flyovers shall be excavated from the embankment site and if it is not possible to do so, only the minimum quantity of soil required for the purpose shall be excavated from soil borrow area. In either case, the topsoil should be kept or stored separately. Voids created due to soil borrow area shall be filled up with ash with proper compaction and covered with topsoil kept separately as above. This would be done as an integral part of embankment project within the time schedule of the project.

(7) No agency, person or organization shall within a radius of 100 kilometres of a coal or lignite based thermal power plant allow reclamation and compaction of low-lying areas with soil. Only pond ash shall be used for compaction. They shall also ensure that such reclamation and compaction is done in accordance with the bye-laws, regulations and specifications laid down by the authorities mentioned in sub-paragraph (3) of paragraph 3.”.

3. In the said notification, in paragraph 2,
- (a) for the marginal heading “**Utilisation of ash by Thermal Power Plants**”, the marginal heading ‘**Responsibilities of Thermal Power Plants**’ shall be substituted;
 - (b) for the opening words, “All coal or lignite based thermal power plants shall utilise the ash generated in the power plants as follows: -”, “Every coal or lignite based thermal power plant shall take the following steps to ensure the utilisation of ash generated by it, namely: -”;
 - (c) in sub-paragraph (1), -

(i) after the words “products such as cement, concrete blocks, bricks, panels”, the words “or a combination thereof” shall be inserted;

(ii) the following shall be added at the end, namely: -

“ The thermal power plants have to ensure availability of fair quantity of ash to each user including brick kilns.”;

4. In the said notification, after paragraph 2, the following paragraph shall be inserted, namely: -

“2A. Utilization of fly ash for reclamation of sea.

“Subject to the rules made under the Environment (Protection) Act, 1986, (29 of 1986) reclamation of sea shall be a permissible method of utilization of fly ash.”.

5. In the said notification, in paragraph 3, the following sub-paragraphs shall be inserted, namely: -

“(2A) All agencies including the Central Public Works Department and State Government agencies concerned with utilization of fly ash for construction purposes shall, within three months from the 1st day of September, 2003 make provisions for the use of fly ash and fly ash based bricks, blocks or tiles or aggregates of them in the schedule of approved materials and rates.

(2B) All agencies undertaking construction of roads or fly over bridges including Ministry of Road Transport and Highways (MORTH), National Highways Authority of India (NHAI), Central Public Works Department (CPWD), State Public Works Departments and other State Government Agencies, shall, within three months from the 1st day of September, 2003 -

- a. make provisions in their tender documents, schedules of approved materials and rates as well as technical documents, including those relating to soil borrow area or pit as per sub-paragraph (7) of paragraph 1; and
- b. make necessary specifications/guidelines for road or fly over embankments that are not covered by the specifications laid down by the Indian Road Congress (IRC).” .

[F.No.16-2/95-HSMD]
(Dr. V. Rajagopalan)
Joint Secretary to the Govt. of India

Footnote. - The principal notification was published in the Gazette of India, Part II, Section 3, sub-section (ii) *vide* S.O.763 (E) dated 14.9.1999.

ANNEXURE VI
MoEF Draft Notification S.O.513 (E) – Utilization of Fly Ash

**MINISTRY OF ENVIRONMENT AND FORESTS
NOTIFICATION**

New Delhi, the 3rd April, 2007

S.O. 513(E).—The following draft of a notification, which the Central Government proposes to issue, in supersession of the existing notification number S.O.763(E) dated the 14th September, 1999 of the Government of India in the Ministry of Environment and Forests, relating to restrictions on the excavation of top soil for manufacture of bricks and promoting the utilisation of fly ash in the manufacture of building materials and in construction activity is hereby published, as required under sub-rule (3) of rule 5 of the Environment (Protection) Rules, 1986, for the information of all persons likely to be affected thereby; and notice is hereby given that the said draft notification will be taken into consideration by the Central Government on or after the expiry of sixty days from the date on which copies of the Gazette containing this notification are made available to the public.

Any person interested in filing any objection(s) or suggestion(s) on the proposed draft notification may do so in writing to the Secretary, Ministry of Environment and Forests, Paryavaran Bhawan, CGO Complex, Lodi Road, New Delhi -110 003, within the said period of sixty days.

DRAFT NOTIFICATION

Whereas, it is necessary to protect the environment, through conserving the top soil, and other non-renewable

resources used in the construction activities, through proper utilisation of fly ash, bottom ash and pond ash, generated from coal and lignite based thermal power plants;

Whereas as per the notification S.O. 763(E) dated the 14-9-1999 the progress of the implementation of the provisions of the said notification has been reviewed;

Whereas the review indicated while the generation of ash increased from about 89 million tonnes in 1999-2000 to about 112 million tonnes in 2005-2006 and the utilisation increased from 13 million tonnes to 51 million tonnes;

Whereas every year about 65 to 75 million tonnes of ash continue to remain unutilised and dumped in ash ponds and the quantity of ash in ash ponds has increased from about 450 million tonnes in 1999-2000 to about 900 million tonnes in 2005-2006;

Whereas the land area under active ash ponds is about 16,000 hectares and needs to be put to gainful use;

Whereas the concerned Central and State Governments and their agencies have already laid down specifications for ash and ash based products;

Whereas the brick kiln owners have represented against compulsory mixing of prescribed quantity of ash with clay on account of difficulties in meeting the cost of transportation;

Whereas the quantity of ash utilised by brick kilns in the past was limited to 0.7 million tonnes in 2004-2005 and 1.14 million tonnes in 2005-2006 and constitute only a small percentage of ash utilised;

Whereas the plans for generation of power envisages setting up of large coal based thermal power plants, which, together with existing plants expected to generate about 150 to 170 million tonnes of ash per year by the end of the 11th Five Year Plan, which need to be properly utilised in order to avoid unnecessary extraction of top soil and other materials for construction activities;

Whereas the Central Government is of the opinion that in view of the increased ash generation, there is a need to accelerate the pace of utilisation of fly ash, bottom ash and pond ash;

Now, therefore, in exercise of the powers conferred by Sub-section (1), read with clause (v) of Sub-section (2) of Section 3 and Section 5 of the Environment (Protection) Act, 1986 (29 of 1986), and in supersession of the Government of India in the Ministry of Environment and Forests number S.O. 763(E) dated the 14th September, 1999 published in the Gazette of India, Part II, Section 3, Sub-section (ii) dated 14th September, 1999, except as respects things done or omitted to be done before such supersession, the Central Government hereby issues the following directions which shall come into force on and from the date of publication of the final notification, namely:

1. Use of fly ash in construction activities:

- (1) After twelve months from the date of publication of this notification, every person engaged in any activity involving building construction shall use buildings materials composed wholly or partly of fly ash (hereafter, the term "fly ash" will refer to fly ash, bottom ash, and pond ash), instead of the corresponding materials made wholly of constructional materials such as clay, top soil, limestone, sand and such other material, wherever the former, on competitive tendering for delivery at the construction site, costs the same or less than the latter, and has not been

found to be technically infeasible for the intended use.

Explanation 1: "Technically infeasible" is to be determined by one or more laboratories to be designated by the Director General, Council of Scientific and Industrial Research.

Explanation 2: "Building materials" in this context refers to bricks, tiles, cement, blocks and similar products or a combination or aggregate of these.

- (2) It shall be the responsibility of all persons and/or the agencies, either undertaking construction, or preparing, or approving the design to ensure compliance of the provisions of sub-paragraph (1).
- (3) The authority for monitoring and enforcing the actual implementation of sub-paragraph (1) above in the construction shall be the concerned local body or development authorities or any other building plan approval or completion certification authority.
- (4) All financial institutions, which fund construction activities, shall include a clause in their loan agreement requesting compliance with sub-paragraph (1) above.
- (5) No person or agency engaged in road (including highways and fly overs) construction may use borrow material excavated from the "right of way" of the road for the construction of road embankments. All construction of road embankments will use fly ash, or municipal inerts, unless:
 - (a) the cost of the fly ash or municipal inerts delivered at the construction site is more than twenty-five per cent higher than the equivalent quantity of soil extracted from other than the "right of way" for embankment use, in which case such soil may be used for the road embankment; or
 - (b) a designated technical authority of the Indian Roads Congress certifies that the use of fly ash or municipal inerts at the location for the intended purpose is technically infeasible;
 - (c) For the top and side covers, soil, other than soil extracted from the "right of way" may be used, notwithstanding (a) above;
- (6) No person or agency shall undertake reclamation and compaction of low-lying areas with soil. Only pond ash shall be used for reclamation or compaction. They shall also ensure that such reclamation and compaction is done in accordance with the byelaws, regulations and specifications laid down by the authorities mentioned in sub-paragraph (3) above.

2. Responsibilities of Thermal Power Plants.—

Owners of Coal or lignite based thermal power plants (including captive and/ or cogeneration plants based on coal or lignite),

- (a) may dispose of fly ash through competitive bids to the best advantage of the owners.

Explanation: In case, the bids are all negative, *i.e.* the bidders require payment to accept the

fly ash for use in accordance with this notification, "best advantage" would mean least payment required bid by the bidders.

- (b) shall not at any time store more than three months ash generation in their storage and/ or ash ponds. In case the quantity of fly ash already in storage and/or ash ponds on and from the date of this notification exceeds three months generation, the same shall be disposed of in accordance with sub-paragraph 1(1) above within a maximum period of five years from the date of issue of this notification.
- (c) shall maintain a record of all sale and/or disposal of the fly ash.
- (d) shall submit annual compliance report, including record of sale and/or disposal of the fly ash as stipulated in sub-paragraph (c) above by the thirtieth day of April every year to the concerned State Pollution Control Board or Committee.

3. Specifications for use of ash-based products/ responsibility of other agencies:

- (1) Manufacture of all ash-based products shall be carried out in accordance with specifications and guidelines laid down by the Bureau of Indian Standards, Indian Bureau of Mines, Indian Road Congress, Central Building Research Institute, Roorkee, Central Road Research Institute, New Delhi, Building Materials and Technology Promotion Council, New Delhi, Central Public Works Department, State Public Works Departments and other Central and State Government agencies, as applicable.
- (2) All Government agencies including the Central Public Works Department and State Government agencies concerned with construction activities shall make provisions for the use of fly ash based products or aggregates of them in the schedule of approved materials and rates.
- (3) Central Electricity Authority while formulating norms for land requirement per Mega Watt of installed capacity of thermal power plants shall ensure that the area for ash storage be restricted to a maximum of three months ash generation.
- (4) All agencies undertaking construction of roads or fly over bridges including Department of Road Transport and Highways, National Highways Authority of India (NHAI), Central Public Works Department (CPWD), State Public Works Departments and other State Government Agencies shall make appropriate provisions in their tender documents, schedules of approved materials and rates, as well as technical documents, including those relating to soil borrow area or pit as per sub-paragraph (5) of paragraph 1.
- (5) All local bodies or development authorities shall specify in their respective building bye-laws and regulations the use of ash and ash-based products and construction techniques in building materials, roads, embankments or for any other use.

[F. No. 9-8/2005-HSMD]

R. ANANDAKUMAR, Adviser

ANNEXURE VII
Form 1 (Application Form for Obtaining EIA Clearance)

FORM 1

(I) BASIC INFORMATION

S. No.	Item	Details
1.	Name of the project/s	
2.	S.No. in the schedule	
3.	Proposed capacity/area/length/tonnage to be handled/command area/lease area/number of wells to be drilled	
4.	New/Expansion/Modernization	
5.	Existing Capacity/Area etc.	
6.	Category of Project i.e., 'A' or 'B'	
7.	Does it attract the general condition? If yes, please specify.	
8.	Does it attract the specific condition? If yes, Please specify.	
9.	Location	
	Plot/Survey/Khasra No.	
	Village	
	Tehsil	
	District	
	State	
10.	Name of the applicant	
11.	Registered Address	
12.	Address for correspondence:	
	Name	
	Designation (Owner/Partner/CEO)	
	Address	
	Pin Code	
	E-mail	
	Telephone No.	
	Fax No.	
13.	Details of alternative Sites examined, if any location of these sites should be shown on a toposheet.	Village-District-State 1. 2. 3.

S. No.	Item	Details
14.	Interlined Projects	
15.	Whether separate application of interlined project has been submitted	
16.	If yes, date of submission	
17.	If no, reason	
18.	Whether the proposal involves approval/clearance under: The Forest (Conservation) Act, 1980 The Wildlife (Protection) Act, 1972 The C.R.Z. Notification, 1991	
19.	Forest land involved (hectares)	
20.	Whether there is any litigation pending against the project and/or land in which the project is propose to be set up Name of the Court Case No. Orders/directions of the Court, if any and its relevance with the proposed project.	

(II) ACTIVITY

1. **Construction, operation or decommissioning of the Project involving actions, which will cause physical changes in the locality (topography, land use, changes in water bodies, etc.)**

S.No.	Information/Checklist confirmation	Yes/No	Details thereof (with approximate quantities /rates, wherever possible) with source of information data
1.1	Permanent or temporary change in land use, land cover or topography including increase in intensity of land use (with respect to local land use plan)		
1.2	Clearance of existing land, vegetation and buildings?		
1.3	Creation of new land uses?		
1.4	Pre-construction investigations e.g. bore houses, soil testing?		
1.5	Construction works?		

S.No.	Information/Checklist confirmation	Yes/No	Details thereof (with approximate quantities /rates, wherever possible) with source of information data
1.6	Demolition works?		
1.7	Temporary sites used for construction works or housing of construction workers?		
1.8	Above ground buildings, structures or earthworks including linear structures, cut and fill or excavations		
1.9	Underground works including mining or tunneling?		
1.10	Reclamation works?		
1.11	Dredging?		
1.12	Offshore structures?		
1.13	Production and manufacturing processes?		
1.14	Facilities for storage of goods or materials?		
1.15	Facilities for treatment or disposal of solid waste or liquid effluents?		
1.16	Facilities for long term housing of operational workers?		
1.17	New road, rail or sea traffic during construction or operation?		
1.18	New road, rail, air waterborne or other transport infrastructure including new or altered routes and stations, ports, airports etc?		
1.19	Closure or diversion of existing transport routes or infrastructure leading to changes in traffic movements?		
1.20	New or diverted transmission lines or pipelines?		
1.21	Impoundment, damming, culverting, realignment or other changes to the hydrology of watercourses or aquifers?		
1.22	Stream crossings?		
1.23	Abstraction or transfers of water form ground or surface waters?		
1.24	Changes in water bodies or the land surface affecting drainage or run-off?		
1.25	Transport of personnel or materials for construction, operation or decommissioning?		

S.No.	Information/Checklist confirmation	Yes/No	Details thereof (with approximate quantities /rates, wherever possible) with source of information data
1.26	Long-term dismantling or decommissioning or restoration works?		
1.27	Ongoing activity during decommissioning which could have an impact on the environment?		
1.28	Influx of people to an area in either temporarily or permanently?		
1.29	Introduction of alien species?		
1.30	Loss of native species or genetic diversity?		
1.31	Any other actions?		

2. Use of Natural resources for construction or operation of the Project (such as land, water, materials or energy, especially any resources which are non-renewable or in short supply):

S.No.	Information/checklist confirmation	Yes/No	Details thereof (with approximate quantities /rates, wherever possible) with source of information data
2.1	Land especially undeveloped or agricultural land (ha)		
2.2	Water (expected source & competing users) unit: KLD		
2.3	Minerals (MT)		
2.4	Construction material – stone, aggregates, sand / soil (expected source – MT)		
2.5	Forests and timber (source – MT)		
2.6	Energy including electricity and fuels (source, competing users) Unit: fuel (MT), energy (MW)		
2.7	Any other natural resources (use appropriate standard units)		

3. Use, storage, transport, handling or production of substances or materials, which could be harmful to human health or the environment or raise concerns about actual or perceived risks to human health.

S.No	Information/Checklist confirmation	Yes/No	Details thereof (with approximate quantities/rates, wherever possible) with source of information data
3.1	Use of substances or materials, which are hazardous (as per MSIHC rules) to human health or the environment (flora, fauna, and water supplies)		
3.2	Changes in occurrence of disease or affect disease vectors (e.g. insect or water borne diseases)		
3.3	Affect the welfare of people e.g. by changing living conditions?		
3.4	Vulnerable groups of people who could be affected by the project e.g. hospital patients, children, the elderly etc.,		
3.5	Any other causes		

4. Production of solid wastes during construction or operation or decommissioning (MT/month)

S.No.	Information/Checklist confirmation	Yes/No	Details thereof (with approximate quantities/rates, wherever possible) with source of information data
4.1	Spoil, overburden or mine wastes		
4.2	Municipal waste (domestic and or commercial wastes)		
4.3	Hazardous wastes (as per Hazardous Waste Management Rules)		
4.4	Other industrial process wastes		
4.5	Surplus product		
4.6	Sewage sludge or other sludge from effluent treatment		
4.7	Construction or demolition wastes		
4.8	Redundant machinery or equipment		

S.No.	Information/Checklist confirmation	Yes/No	Details thereof (with approximate quantities/rates, wherever possible) with source of information data
4.9	Contaminated soils or other materials		
4.10	Agricultural wastes		
4.11	Other solid wastes		

5. Release of pollutants or any hazardous, toxic or noxious substances to air (kg/hr)

S.No	Information/Checklist confirmation	Yes/No	Details thereof (with approximate quantities/rates, wherever possible) with source of information data
5.1	Emissions from combustion of fossil fuels from stationary or mobile sources		
5.2	Emissions from production processes		
5.3	Emissions from materials handling including storage or transport		
5.4	Emissions from construction activities including plant and equipment		
5.5	Dust or odours from handling of materials including construction materials, sewage and waste		
5.6	Emissions from incineration of waste		
5.7	Emissions from burning of waste in open air (e.g. slash materials, construction debris)		
5.8	Emissions from any other sources		

6. Generation of Noise and Vibration, and Emissions of Light and Heat:

S.No.	Information/Checklist confirmation	Yes/No	Details thereof (with approximate quantities/rates, wherever possible) with source of information data with source of information data
6.1	From operation of equipment e.g. engines, ventilation plant, crushers		
6.2	From industrial or similar processes		
6.3	From construction or demolition		
6.4	From blasting or piling		
6.5	From construction or operational traffic		
6.6	From lighting or cooling systems		
6.7	From any other sources		

7. Risks of contamination of land or water from releases of pollutants into the ground or into sewers, surface waters, groundwater, coastal waters or the sea:

S.No.	Information/Checklist confirmation	Yes/No	Details thereof (with approximate quantities/rates, wherever possible) with source of information data
7.1	From handling, storage, use or spillage of hazardous materials		
7.2	From discharge of sewage or other effluents to water or the land (expected mode and place of discharge)		
7.3	By deposition of pollutants emitted to air into the land or into water		
7.4	From any other sources		
7.5	Is there a risk of long term build up of pollutants in the environment from these sources?		

8. Risk of accidents during construction or operation of the Project, which could affect human health or the environment

S.No	Information/Checklist confirmation	Yes/No	Details thereof (with approximate quantities/rates, wherever possible) with source of information data
8.1	From explosions, spillages, fires etc from storage, handling, use or production of hazardous substances		
8.2	From any other causes		
8.3	Could the project be affected by natural disasters causing environmental damage (e.g. floods, earthquakes, landslides, cloudburst etc)?		

9. Factors which should be considered (such as consequential development) which could lead to environmental effects or the potential for cumulative impacts with other existing or planned activities in the locality

S. No.	Information/Checklist confirmation	Yes/No	Details thereof (with approximate quantities/rates, wherever possible) with source of information data
9.1	Lead to development of supporting facilities, ancillary development or development stimulated by the project which could have impact on the environment e.g.: <ul style="list-style-type: none"> ▪ Supporting infrastructure (roads, power supply, waste or waste water treatment, etc.) ▪ housing development ▪ extractive industries ▪ supply industries ▪ other 		
9.2	Lead to after-use of the site, which could have an impact on the environment		
9.3	Set a precedent for later developments		
9.4	Have cumulative effects due to proximity to other existing or planned projects with similar effects		

(III) ENVIRONMENTAL SENSITIVITY

S.No.	Areas	Name/ Identity	Aerial distance (within 15 km.) Proposed project location boundary
1	Areas protected under international conventions, national or local legislation for their ecological, landscape, cultural or other related value		
2	Areas which are important or sensitive for ecological reasons - Wetlands, watercourses or other water bodies, coastal zone, biospheres, mountains, forests		
3	Areas used by protected, important or sensitive species of flora or fauna for breeding, nesting, foraging, resting, over wintering, migration		
4	Inland, coastal, marine or underground waters		
5	State, National boundaries		
6	Routes or facilities used by the public for access to recreation or other tourist, pilgrim areas		
7	Defence installations		
8	Densely populated or built-up area		
9	Areas occupied by sensitive man-made land uses (<i>hospitals, schools, places of worship, community facilities</i>)		
10	Areas containing important, high quality or scarce resources (<i>ground water resources, surface resources, forestry, agriculture, fisheries, tourism, minerals</i>)		
11	Areas already subjected to pollution or environmental damage. (<i>those where existing legal environmental standards are exceeded</i>)		
12	Areas susceptible to natural hazard which could cause the project to present environmental problems (<i>earthquakes, subsidence, landslides, erosion, flooding or extreme or adverse climatic conditions</i>)		

(IV) PROPOSED TERMS OF REFERENCE FOR EIA STUDIES

“I hereby given undertaking that the data and information given in the application and enclosure are true to the best of my knowledge and belief and I am aware that if any part of the data and information submitted is found to be false or misleading at any stage, the project will be rejected and clearance give, if any to the project will be revoked at our risk and cost.

Date: _____

Place: _____

Signature of the applicant
With Name and Full Address
(Project Proponent / Authorized Signatory)

NOTE:

1. The projects involving clearance under Coastal Regulation Zone Notification, 1991 shall submit with the application a C.R.Z. map duly demarcated by one of the authorized, agencies, showing the project activities, w.r.t. C.R.Z. and the recommendations of the State Coastal Zone Management Authority. Simultaneous action shall also be taken to obtain the requisite clearance under the provisions of the C.R.Z. Notification, 1991 for the activities to be located in the CRZ.
2. The projects to be located within 10km of the National Parks, Sanctuaries, Biosphere Reserves, Migratory Corridors of Wild Animals, the project proponent shall submit the map duly authenticated by Chief Wildlife Warden showing these features vis-à-vis the project location and the recommendations or comments of the Chief Wildlife Warden thereon.”

ANNEXURE VIII
Critically Polluted Industrial Areas and Clusters/Potential Impact
Zone

**DETAILS OF CRITICALLY POLLUTED INDUSTRIAL AREAS AND
CLUSTERS / POTENTIAL IMPACT ZONE IN TERMS OF THE OFFICE
MEMORANDUM NO. J-11013/5/2010-IA.II(I) DATED 13.1.2010**

V.	Proposed broad mitigation measures which could effectively be internalized as project components to have environmental and social acceptance of the proposed site	<ul style="list-style-type: none"> ▪ Preventive measures ▪ Source control measures ▪ Mitigation measures at the receiving environment, <i>etc.</i>
VI.	An indication of any difficulties (technical deficiencies or lack of know-how) encountered by the developer in compiling the required information.	

The above listing is not exhaustive. Thus the proponent may provide additional necessary information, felt appropriate, to include in the pre-feasibility study report in support of selecting the site for the proposed developmental activities. The Concerned EAC during scrutiny, may specifically ask for any additional information/data required to substantiate the requirement to prescribe the ToR for EIA studies. However, it is to make clear that all the required further information by EAC may be mentioned in one single letter, within the prescribed time.

ANNEXURE X
Types of Monitoring and Network Design Considerations

TYPES OF MONITORING AND NETWORK DESIGN CONSIDERATIONS

A. Types of Monitoring

Monitoring refers to the collection of data using a series of repetitive measurements of environmental parameters (or, more generally, to a process of systematic observation). The environmental quality monitoring programme design will be dependent upon the monitoring objectives specified for the selected area of interest. The main types of EIA monitoring activities are:

- Baseline monitoring is the measurement of environmental parameters during the pre-project period for the purpose of determining the range of variation of the system and establishing reference points against which changes can be measured. This leads to the assessment of the possible (additional available) assimilative capacity of the environmental components in pre-project period w.r.t. the standard or target level.
- Effects monitoring is the measurement of environmental parameters during project construction and implementation to detect changes which are attributable to the project to provide the necessary information to:
 - verify the accuracy of EIA predictions; and
 - determine the effectiveness of measures to mitigate adverse effects of projects on the environment.
 - Feedback from environmental effect monitoring programs may be used to improve the predictive capability of EIAs and also determine whether more or less stringent mitigation measures are needed
- Compliance monitoring is the periodic sampling or continuous measurement of environmental parameters to ensure that regulatory requirements and standards are being met.

Compliance and effects monitoring occurs during the project construction, operation, and abandonment stages. The resources and institutional set-up should be available for the monitoring at these stages. To control the environmental hazards of construction as specified in the EIA, a monitoring program shall be established to ensure that each mitigation measure is effectively implemented. There are numerous potential areas for monitoring during operations.

The scope of monitoring topics discussed in this chapter is limited to Baseline and Effects monitoring. In addition, this chapter will also discuss the Compliance monitoring during the construction phase. Post-project monitoring requirements are discussed in the EMP

Before any field monitoring tasks are undertaken there are many institutional, scientific, and fiscal issues that must be addressed in the implementation of an environmental monitoring program. Careful consideration of these issues in the design and planning stages will help avoid many of the pitfalls associated with environmental monitoring programs. Although these issues are important but the discussions here are confined to the monitoring network design component.

B. Network Design

Analysis of Significant Environmental Issues

At the outset of planning for an environmental monitoring network, the EIA manager may not know exactly what should be monitored, when monitoring should begin, where it should monitor, which techniques should be employed, and who should take responsibility for its conduct. Because there are usually a number of objective decisions associated with network design to be made. It is important to start with an analysis of environmental issues. The scoping phase of EIA is designed to identify and focus the major issues. Scoping should provide a valuable source of information on the concerns that need to be addressed by the monitoring network design. These are project specific as well as specific to the environmental setting of the location where the project is proposed to be located.

Hence, the network designs are associated with questions like:

- What are the expected outputs of the monitoring activity?
- Which problems do we need to address to? *etc.*

Defining the output will influence the design of the network and optimize the resources used for monitoring. It will also ensure that the network is specially designed to optimize the information on the problems at hand.

What to Monitor?

The question of what to monitor is associated with the identification of VEC

VECs are the qualitative or quantitative environmental values the country desire to protect and preserve in our environment. The environmental values are what we ultimately are trying to protect, or are striving for, with respect to the environment. Examples of environmental values are contaminant-free fish, or sustainable fisheries in our endeavor of Ecology, *etc.*

The choice of VECs is related to the perceived significant impact on the project implementation on important environmental components. In general, the significance or importance of environmental components is judged based on:

- legal protection provided (Ex: rare and endangered species);
- political or public concerns (Ex: resource use conflicts and sustainable development);
- scientific judgment (Ex: ecological importance); or
- commercial or economic importance.

However, in addition to their economic, social, political or ecological significance, the chosen VEC should also have unambiguous operational ease, be accessible to prediction and measurement; and be susceptible to hazard. Once the VECs are defined, the VECs may be directly measured (for example, extent of habitat for an endangered species). In cases where it is impossible or impractical to directly measure the VECs, the chosen measurement endpoints or environmental indicators must correspond to, or be predictive of assessment endpoints.

The chosen environmental indicators must be: 1) measurable; 2) appropriate to the scale of disturbance/ contamination; 3) appropriate to the impact mechanism; 4) appropriate and proportional to temporal dynamics; 5) diagnostic; and 6) standardized; as well as have: 1) a low natural variability; 2) a broad applicability; and 3) an existing data series.

Where, How and How Many Times to Monitor?

These are the other components of monitoring network design. These questions are best answered based on local field conditions, capacity and resources available, prevailing legal and regulatory priorities *etc.* For this screening or reconnaissance surveys of the study area are also necessary. This may also include some simple inexpensive measurements and assimilative/ dispersion modeling. The data will give some information on the prevailing special and temporal variations, and the general background air pollution in the area. The number of monitoring stations and the indicators to be measured at each station in the final permanent network may then be decided upon as based on the results of the screening study as well as on the knowledge of the sources of the proposed development and prevailing local environmental/meteorological conditions. The best possible definition of the air pollution problem, together with the analysis of the resources: personnel, budget and equipment available, represent the basis for the decision on the following questions:

- What spatial density (number) of sampling stations is required? How many samples are needed and during what period (sampling (averaging) time and frequency)?
- Where should the stations be located?
- What kind of equipment should be used?
- What additional background information is needed?
 - meteorology
 - topography
 - population density
 - emission sources and emission rates
 - effects and impacts
- How will the data be made available/communicated?

C. Site Selection

When considering the location of individual samplers, it is essential that the data collected are representative for the location and type of area without the undue influence from the immediate surroundings. In any measurement point in the study area the total ambient concentration is the representative of:

- natural background concentration,
- regional background,
- impact of existing large regional sources such as Industrial emissions and other power plants.

To obtain the information about the importance of these different contributions it is therefore necessary to locate monitoring stations so that they are representative for different impacts. In addition to the ambient pollution data, one would often need other data governing the variations such as meteorological data for air pollution, to identify and quantify the sources contributing to the measurements.

ANNEXURE XI
Guidance for Assessment of Baseline Components and Attributes

GUIDANCE FOR ASSESSMENT OF BASELINE COMPONENTS AND ATTRIBUTES*

Attributes	Sampling		Measurement Method	Remarks	Applications to Thermal Power Plants
	Network	Frequency			
A. Air					
<ul style="list-style-type: none"> ▪ Meteorological ▪ Wind speed ▪ Wind direction ▪ Dry bulb temperature ▪ Wet bulb temperature ▪ Relative humidity ▪ Rainfall ▪ Solar radiation ▪ Cloud cover 	<p>Minimum 1 site in the project impact area requirements</p> <p>Other additional site(s) are require depending upon the model applied or site sensitivities</p>	<p>Min: 1 hrly observations from continuous records</p>	<p>Mechanical / automatic weather station</p> <p>Rain gauge</p> <p>As per IMD</p> <p>As per IMD</p>	<p>IS 5182 Part 1-20 Sit-specific primary data is essential</p> <p>Secondary data from IMD, New Delhi for the nearest IMD station</p>	<p>Meteorological observations are guided by the site sensitivities and/or model used. For example ISCST model one location is acceptable whereas for AIRMOD vertical temperature profile (two height observations) is also required.</p>
<p>Pollutants</p> <ul style="list-style-type: none"> ▪ SPM ▪ RPM ▪ SO₂ ▪ NO₂ ▪ CO ▪ H₂S* ▪ NH₃* ▪ HC* ▪ Fluoride* ▪ Pb* 	<p>10 to 15 locations in the project impact area</p>	<p>24 hrly twice a week</p> <p>8 hrly twice a week</p> <p>24 hrly twice a week</p>	<ul style="list-style-type: none"> ▪ Gravimetric (High – Volume) ▪ Gravimetric (High – Volume with Cyclone) ▪ EPA Modified West & Gaeke method ▪ Arsenite Modified Jacob & Hochheiser ▪ NDIR technique ▪ Methylene-blue 	<p>Monitoring Network</p> <ul style="list-style-type: none"> ▪ Minimum 2 locations in upwind side, more sites in downwind side / impact zone ▪ All the sensitive receptors 	<p>Parameters & frequency are defined in ToR for EIA studies based on raw material (type of fuel) & process technology, location-nature/activities within of air basin.</p> <p>For example TPP located on a pit-head or power</p>

Attributes	Sampling		Measurement Method	Remarks	Applications to Thermal Power Plants
	Network	Frequency			
<ul style="list-style-type: none"> ▪ VOC-PAH* ▪ Mercury* (parameters to be proposed by the proponent, in draft ToR, which will be reviewed and approved by EAC/SEAC)			<ul style="list-style-type: none"> ▪ Nessler's Method ▪ Infra Red analyzer ▪ Specific Ion meter 	need to be covered Measurement Methods As per CPCB standards for NAQM, 1994	generation in the impact zone is high (more than 10000MWs) then mercury, VOC, O ₃ should be included
B. Noise					
Hourly equivalent noise levels	Same as for Air Pollution along with others Identified in study area	At least one day continuous in each season on a working and non-working day	Instrument : Sensitive Noise level meter (preferably recording type)	Min: IS: 4954-1968 as adopted by CPCB	For TPP projects DG sets, turbines, pumps, crushers, coal & material handing process are important sources of noise
Hourly equivalent noise levels	Inplant (1.5 m from machinery or high emission processes)	Same as above for day and night	Instrument : Noise level metre	CPCB / OSHA	
Hourly equivalent noise levels	Highways (within 500 metres from the road edge)	Same as above for day and night	Instrument : Noise level meter	CPCB / IS : 4954-1968	
Peak particle velocity	150- 200m from blast site	Based on hourly observations	PPV meter		Very important source during construction phase of certain project locations

Attributes	Sampling		Measurement Method	Remarks	Applications to Thermal Power Plants
	Network	Frequency			
C. Water					
Parameters for water quality <ul style="list-style-type: none"> ▪ Ph, temp, turbidity, magnesium hardness, total alkalinity, chloride, sulphate, nitrate, fluoride, sodium, potassium salinity ▪ Total nitrogen, total phosphorus, DO, BOD, COD, Phenol ▪ Heavy metals ▪ Total coliforms, faecal coliforms ▪ Phyto plankton ▪ Zooplankton ▪ Fish & other aquatic flora & fauna (parameters are given in ToR for EIA studies based on nature of project, raw material & process technology, location-nature/activities within of air basin)	Set of grab samples during pre and post-monsoon for ground and surface water for the whole study zone. For lab. Analysis the samples should be preserved for transport safe	Diurnal and season-wise	Samples for water quality should be collected and analyzed as per: IS: 2488 (Part 1-5) methods for sampling and testing of industrial effluents Standard methods for examination of water and waste water analysis published by American Public Health Association. International standard practices for benthos and aquatic flora & fauna		Parameters are defined in ToR for EIA studies based on power generation technology and location-nature/activities within the study area and nature of waste water receiving body-river, lake, coast discharges etc. For example TPP located in coast zone (waste water discharged through ocean out-falls), the coastal water quality and health of costal flora and fauna all along coast line with extended impacted zone need to be monitored. Besides the requirements of Water Quality

Attributes	Sampling		Measurement Method	Remarks	Applications to Thermal Power Plants
	Network	Frequency			
					Model should also be addressed
For Surface Water Bodies					
<ul style="list-style-type: none"> ▪ Total Carbon ▪ PH ▪ Dissolved Oxygen ▪ Biological Oxygen Demand ▪ Free NH₄ ▪ Boron ▪ Sodium Absorption ratio ▪ Electrical Conductivity 	<p>Monitoring locations should include up-stream, on site, down stream of proposed discharge point. Besides sampling should cover width of the river in case water quality modeling is proposed. Standard methodology for collection of surface water (BIS standards)</p> <p>At least one grab sample per location per season</p>	<p>Yield & impact on water sources to be measured during critical season</p> <p>River Stretch within project area be divided in grids (say 1 km length and 1/3 width) and samples should be from each grid at a time when the wastewater discharged by other sources of pollution is expected to be maximum</p>	<p>Samples for water quality should be collected and analyzed as per:</p> <p>IS: 2488 (Part 1-5) methods for sampling and testing of industrial effluents</p> <p>Standard methods for examination of water and wastewater analysis published by American Public Health Association.</p>	<p>Historical data should be collected from relevant offices such as central water commission, state and central ground water board, Irrigation dept.</p>	<p>For two surface water (rivers and lakes) bodies besides water quality parameters as mentioned above, the location specific network design will also be guided by the model used. For rivers and lakes QUEL2E should suffice which require relatively less information even for two dimensional model applications.</p>
Parameters for wastewater characterization					
<ul style="list-style-type: none"> ▪ Temp, colour, odour, turbidity, TSS, TDS 	<p>Implant Source depending upon</p>	<p>Different operational cycles as well as raw</p>	<p>Samples for water quality should be</p>	<p>All plant sources categorized as:</p>	<p>Although waste water</p>

Attributes	Sampling		Measurement Method	Remarks	Applications to Thermal Power Plants
	Network	Frequency			
<ul style="list-style-type: none"> ▪ PH , alkalinity as CaCO₃, p value, M value, total hardness as CaCO₃, chloride as cl, sulphate as S₀₄, Nitrate as NO₃, Floride as F, Phosphate as P₀₄, Chromium as Cr (Hexavalent, total) Ammonical Nitrogen as N, TKN, % sodium, BOD at 20 C, COD, DO, total residual chlorine as Cl₂, oil and grease, sulphide, phenolic compound 	<p>the different waste streams the parameters can be optimized</p> <p>Grab and composite sampling representing avg of different process operations as well as worst emission scenario should be represented</p>	<p>material variations should be reflected in the analysis</p>	<p>collected and analyzed as per: IS: 2488 (Part 1-5) methods for sampling and testing of industrial effluents</p> <p>Standard methods for examination of water and wastewater analysis published by American Public Health Association.</p>	<ul style="list-style-type: none"> ▪ Different Process waste streams as well as run-off conditions ▪ ETP wastewater ▪ Domestic/ sanitary wastewater 	<p>characteristics of TPP emissions are not very critical but still high temperature emissions from cooling tower may impact the aquatic biota (particularly in coastal area and lacks. For impact assessment the required water quality modeling should be performed</p>
D. Land Environment					
<ul style="list-style-type: none"> ▪ Soil ▪ Particle size distribution ▪ Texture ▪ pH ▪ Electrical conductivity ▪ Caution exchange capacity ▪ Alkali metals ▪ Sodium Absorption Ratio (SAR) ▪ Permeability ▪ Porosity 	<p>One surface sample from each landfill and/or hazardous waste site (if applicable) and prime villages, (soil samples be collected as per BIS specifications) in the study area</p>	<p>Season-wise</p>	<p>Collected and analyzed as per soil analysis reference book, M.I.Jackson and soil analysis reference book by C.A. Black</p>	<p>The purpose of impact assessment on soil (land environment) is to assess the significant impacts due to leaching of wastes or accidental releases and contaminating</p>	<p>In the case of TPP the impact sites of leaching from ass-pond, coal dumps or accidental spillage of hazardous wastes/oils are important</p>

Attributes	Sampling		Measurement Method	Remarks	Applications to Thermal Power Plants
	Network	Frequency			
Landuse / Landscape					
<ul style="list-style-type: none"> ▪ Location code ▪ Total project area ▪ Topography ▪ Drainage (natural) ▪ Cultivated, forest plantations, water bodies, roads and settlements 	At least 20 points along with plant boundary and general major land use categories in the study area.	Drainage once in the study period and land use categories from secondary data (local maps) and satellite imageries	<ul style="list-style-type: none"> ▪ Global positioning system ▪ Topo-sheets ▪ Satellite Imageries (1:25,000) ▪ Satellite Imageries (1:25,000) 	Drainage within the plant area and surrounding is very important for storm water impacts. From land use maps sensitive receptors (forests, parks, mangroves etc.) can be identified	General remarks are also pertinent for power plants
E. Solid Waste					
<p>Quantity:</p> <ul style="list-style-type: none"> ▪ Based on waste generated from per unit production ▪ Per capita contribution ▪ Collection, transport and disposal system ▪ Process Waste ▪ Quality (oily, chemical, biological) 	For green field unites it is based on secondary data base of earlier plants.	Process wise or activity wise for respective raw material used. Domestic waste depends upon the season also	<p>Guidelines</p> <p>IS 9569 : 1980 IS 10447 : 1983 IS 12625 : 1989 IS 12647 : 1989 IS 12662 (PTI) 1989</p>		
<p>Quality:</p> <ul style="list-style-type: none"> ▪ General segregation into biological/organic/inert/hazar 	Grab and Composite samples	Process wise or activity wise for respective raw material used. Domestic waste depends upon the	<p>Analysis</p> <p>IS 9334 : 1979 IS 9235 : 1979</p>		

Attributes	Sampling		Measurement Method	Remarks	Applications to Thermal Power Plants
	Network	Frequency			
dous <ul style="list-style-type: none"> ▪ Loss on heating ▪ pH ▪ Electrical Conductivity ▪ Calorific value, metals etc. 		season also	IS 10158 : 1982		
Hazardous Waste					
<ul style="list-style-type: none"> ▪ Permeability And porosity ▪ Moisture pH ▪ Electrical conductivity ▪ Loss on ignition ▪ Phosphorous ▪ Total nitrogen ▪ Caution exchange capacity ▪ Particle size distribution ▪ Heavy metal ▪ Ansonia ▪ Fluoride 	Grab and Composite samples. Recyclable components have to analyzed for the recycling requirements	Process wise or activity wise for respective raw material used.	Analysis IS 9334 : 1979 IS 9235 : 1979 IS 10158 : 1982	Impacts of hazardous waste should be performed critically depending on the waste characteristics and place of discharge. For land disposal the guidelines should be followed and impacts of accidental releases should be assessed	Although Power plants do not involve very critical hazardous waste problem but still chlorine storage, oil leakages are important considerations
F. Biological Environment Aquatic					
<ul style="list-style-type: none"> ▪ Primary productivity ▪ Aquatic weeds ▪ Enumeration of phytoplankton, zooplankton 	Considering probable impact, sampling points and number of	Season changes are very important	Standards techniques (APHA et. Al. 1995, Rau and Wooten 1980) to be followed	Seasonal sampling for aquatic biota	Impacts of Power Plant emissions depends on the fuel use/technology and

ANNEXURE XIII
Impact Prediction Tools

Table 1: Choice of Methods for Impact Prediction: Air Environment *

Model	Application	Remarks	Remarks for Power plants Applications
ISCST 3	<p>Appropriate for point, area and line sources Application for flat or rolling terrain Transport distance up to 50 km valid Computes for 1 hr to annual averaging periods</p>	<p>Can take up to 99 sources Computes concentration on 600 receptors in Cartesian on polar coordinate system Can take receptor elevation</p> <p>Requires source data, meteorological and receptor data as input.</p>	<p>ISCST3 is appropriate for TPP located in both simple terrain, where the terrain features are all lower in elevation than the top of the stack of the source, and in complex terrain, where terrain elevations rise to heights above the stack top. The meteorological data required to run ISCST3 includes mixing heights, wind direction, wind velocity, temperature, atmospheric stability and anemometer height.</p>
AERMOD with AERMET	<p>Settling and dry deposition of particles; Building wake effects (excluding cavity region impacts); Point, area, line, and volume sources; Plume rise as a function of downwind distance; Multiple point, area, line, or volume sources; Limited terrain adjustment; Long-term and short-term averaging modes; Rural or urban modes; Variable receptor grid density; and Actual hourly meteorology data</p>	<p>Can take up to 99 sources Computes concentration on 600 receptors in Cartesian on polar coordinate system Can take receptor elevation</p> <p>Requires source data, meteorological and receptor data as input.</p>	<p>AERMOD, is a state-of-art and steady-state plume dispersion model for assessment of pollutant concentrations from a variety of sources. AERMOD simulates transport and dispersion from multiple points, area, or volume sources based on an up-to-date characterization of the atmospheric boundary layer. Sources may be located in rural or urban areas, and receptors may be located in simple or complex terrain. AERMOD accounts for building near-wake and far-wake effects (i.e., plume downwash) using the PRIME wake effect model. The AERMOD model employs hourly sequential meteorological data to estimate concentrations for averaging times ranging from one hour to one year. The AERMET module is the meteorological preprocessor for the AERMOD program. Output includes surface meteorological observations and parameters and vertical profiles of several atmospheric parameters. AERMET is a general purpose meteorological preprocessor for organizing available meteorological data into a format suitable for use by the AERMOD air quality</p>

Model	Application	Remarks	Remarks for Power plants Applications
			dispersion model
PTMAX	Screening model applicable for a single point source Computes maximum concentration and distance of maximum concentration occurrence as a function of wind speed and stability class	Require source characteristics No met data required Used mainly for ambient air monitoring network design	
PTDIS	Screening model applicable for a single point source Computes maximum pollutant concentration and its occurrences for the prevailing meteorological conditions	Require source characteristics Average met data (wind speed, temperature, stability class etc.) required Used mainly to see likely impact of a single source	
MPTER	Appropriate for point, area and line sources applicable for flat or rolling terrain Transport distance up to 50 km valid Computes for 1 hr to annual averaging periods Terrain adjustment is possible	Can take 250 sources Computes concentration at 180 receptors up to 10 km Requires source data, meteorological data and receptor coordinates	
CTDM PLUS (Complex Terrain Dispersion Model)	Point source steady state model, can estimate hrly average concentration in isolated hills/ array of hills	Can take maximum 40 Stacks and computes concentration at maximum 400 receptors Does not simulate calm met conditions Hill slopes are assumed not to exceed 15 degrees Requires sources, met and terrain characteristics and receptor details	
UAM (Urban Airshed Model)	3-D grid type numerical simulation model Computes O ₃ concentration short term episodic conditions lasting for 1 or 2 days resulting from NO _x and VOCs Appropriate for single urban area having significant O ₃ problems		
RAM (Rural Airshed Model)	Steady state Gaussian plume model for computing concentration of relatively stable pollutants for 1 hr to 1 day averaging time Application for point and area sources in rural and urban setting	Suitable for flat terrains Transport distance less than 50 km.	
CRESTER	Applicable for single point source either in rural or urban setting Computes highest and second highest concentration for 1hr, 3hr, 24hr and annual averaging times Tabulates 50 highest concentration for entire year	Can take up to 19 Stacks simultaneously at a common site. Unsuitable for cool and high velocity emissions Do not account for tall buildings or topographic features Computes concentration at	

Model	Application	Remarks	Remarks for Power plants Applications
	for each averaging times	180 receptor, circular wing at five downwind ring distance 36 radials Require sources, and met data	
OCD (Offshore and coastal Dispersion Model)	It determines the impact of offshore emissions from point sources on the air quality of coastal regions It incorporates overwater plume transport and dispersion as well as changes that occur as the plume crosses the shore line Most suitable for overwater sources shore onshore receptors are below the lowest shore height	Requires source emission data Require hrly met data at offshore and onshore locations like water surface temperature; overwater air temperature; relative humidity etc.	
FDM (Fugitive Dust Model)	Suitable for emissions from fugitive dust sources Source may be point, area or line (up to 121 source) Require particle size classification max. up to 20 sizes Computes concentrations for 1 hr, 3hr, 8hr, 24hr or annual average periods	Require dust source particle sizes Source coordinates for area sources, source height and geographic details Can compute concentration at max. 1200 receptors Require met data (wind direction, speed, Temperature, mixing height and stability class) Model do not include buoyant point sources, hence no plume rise algorithm	
RTDM (Rough Terrain Diffusion Model)	Estimates GLC is complex/rough (or flat) terrain in the vicinity of one or more co-located point sources Transport distance max. up to 15 km to up to 50 km Computes for 1 to 24 hr. or annual average concentrations	Can take up to 35 co-located point sources Require source data and hourly met data Computes concentration at maximum 400 receptors Suitable only for non reactive gases Do not include gravitational effects or depletion mechanism such as rain/ wash out, dry deposition	
CDM(Climatologically Dispersion Model)	It is a climatologically steady state GPM for determining long term (seasonal or annual) Arithmetic average pollutant concentration at any ground level receptor in an urban area	Suitable for point and area sources in urban region, flat terrain Valid for transport distance less than 50 km Long term averages: One month to one year or longer	
PLUVUE-II (Plume Visibility Model)	Applicable to assess visibility impairment due to pollutants emitted from well defined point sources It is used to calculate visual range reduction and atmospheric discoloration caused by plumes	Require source characteristics, met data and receptor coordinates & elevation Require atmospheric aerosols (back ground & emitted) characteristics, like density, particle size	

Model	Application	Remarks	Remarks for Power plants Applications
	It predicts transport, atmospheric diffusion, chemical, conversion, optical effects, and surface deposition of point source emissions.	Require background pollutant concentration of SO ₄ , NO ₃ , NO _x , NO ₂ , O ₃ , SO ₂ and deposition velocities of SO ₂ , NO ₂ and aerosols	
MESO-PUFF II (Meso scale Puff Model)	It is a Gaussian, Variable trajectory, puff superposition model designed to account for spatial and temporal variations in transport, diffusion, chemical transformation and removal mechanism encountered on regional scale. Plume is modeled as a series of discrete puffs and each puff is transported independently. Appropriate for point and area sources in urban areas. Regional scale model.	Can model five pollutants simultaneously (SO ₂ , SO ₄ , NO _x , HNO ₃ and NO ₃) Require source characteristics Can take 20 point sources or 5 area source For area source – location, effective height, initial puff size, emission is required Computes pollutant concentration at max. 180 discrete receptors and 1600 (40 x 40) grided receptors Require hourly surface data including cloud cover and twice a day upper air data (pressure, temp, height, wind speed, direction) Do not include gravitational effects or depletion mechanism such as rain/ wash out, dry deposition	

Table 2: Choice of Methods for Impact Modeling: Noise Environment *

Model	Application
FHWA (Federal Highway Administration)	Noise Impact due to vehicular movement on highways
Dhwani	For predictions of impact due to group of noise sources in the industrial complex (multiple sound sources)
Hemispherical sound wave propagation Air Port	Fore predictive impact due to single noise source For predictive impact of traffic on airport and rail road

Table 3: Choice of Methods for Impact Modeling: Water Environment *

Model	Application	Remarks
QUAL-II E	Wind effect is insignificant, vertical dispersive effects insignificant applicable to streams Data required Deoxygenation coefficients, re-aeration coefficients for carbonaceous, nitrogenous and benthic substances, dissolved oxygen deficit	Steady state or dynamic model
	The model is found excellent to generate water quality parameters Photosynthetic and respiration rate of suspended and attached algae	
	Parameters measured up to 15 component can be simulated in any combination, e.g. ammonia, nitrite, nitrate, phosphorous, carbonaceous BOD, benthic oxygen demand, DO, coliforms,	

Model	Application	Remarks
	conservative substances and temperature	
DOSAG-3, USEPA:(1-D) RECEIV-II, USEPA	Water quality simulation model for streams & canal A general Water quality model	Steady-state
Explore-I, USEPA	A river basin water quality model	Dynamic, Simple hydrodynamics
HSPE, USEPA	Hydrologic simulation model	Dynamic, Simple hydrodynamics
RECEIVE-II, USEPA	A general dynamic planning model for water quality management	
Stanford watershed model	This model simulates stream flows once historic precipitation data are supplied The major components of the hydrologic cycle are modeled including interception, surface detention, overland inflow, groundwater, evapo-transpiration and routing of channel flows, temperature, TDS, DO, carbonaceous BOD coliforms, algae, zooplanktons, nitrite, nitrate, ammonia, phosphate and conservative substances can be simulated	
Hydrocomp model	Long-term meteorological and wastewater characterization data is used to simulate stream flows and stream water quality	Time dependant (Dynamic)
Stormwater Management model (SWMM)	Runoff is modeled from overland flow, through surface channels, and through sewer network Both combined and separate sewers can be modeled. This model also enables to simulate water quality effects to stormwater or combined sewer discharges. This model simulates runoff resulting from individual rainfall events.	Time Dependent
Battelle Reservoir model	Water body is divided into segments along the direction of the flow and each segment is divided into number of horizontal layers. The model is found to generate excellent simulation of temperature and good prediction of water quality parameters. The model simulates temperature, DO, total and benthic BOD, phytoplankton, zooplankton, organic and inorganic nitrogen, phosphorous, coliform bacteria, toxic substances and hydrodynamic conditions.	Two Dimensional multi-segment model
TIDEP (Turbulent diffusion temperature model reservoirs)	Horizontal temperature homogeneity Coefficient of vertical turbulent diffusion constant for charge of area with depth negligible coefficient of thermal exchange constant Data required wind speed, air temperature, air humidity, net incoming radiation, surface water temperature, heat exchange coefficients and vertical turbulent diffusion coefficients.	Steady state model
BIOLAKE	Model estimates potential fish harvest from a take	Steady state model
Estuary models/ estuarial Dynamic model	It is simulates tides, currents, and discharge in shallow, vertically mixed estuaries excited by ocean tides, hydrologic influx, and wind action Tides, currents in estuary are simulated	Dynamic model
Dynamic Water Quality Model	It simulates the mass transport of either conservative or non-conservative quality constituents utilizing information derived from the hydrodynamic model Bay-Delta model is the programme generally used. Up to 10 independent quality parameters of either conservative or non-conservative type plus the BOD-DO coupled relationship can be handled	Dynamic model
HEC -2	To compute water surface profiles for steady, gradually: varying flow in both prismatic & non- prismatic channels	
SMS	Lake circulation, salt water intrusion, surface water profile simulation model	Surface water Modelling system Hydrodynamic model
RMA2	To compute flow velocities and water surface elevations	Hydrodynamic

Model	Application	Remarks
		analysis model
RMA4	Solves adjective-diffusion equations to model up to six non-interacting constituents	Constituent transport model
SED2D-WES	Model simulates transport of sediment	Sediment transport model
HIVEL2D	Model supports subcritical and supercritical flow analysis	A 2-dimensional hydrodynamic model
MIKE-II, DHI	Model supports, simulations of flows, water quality, and sediment transport in estuaries, rives, irrigation systems, channels & other water bodies	Professional Engineering software package

Table 4: Choice of Methods for Impact Modeling: Land Environment *

Model	Application	Remarks
Digital Analysis Techniques	Provides land use / land cover distribution	
Ranking analysis for soil suitability criteria	Provides suitability criteria for developmental conversation activities	Various parameters viz. depth, texture, slope, erosion status, geomorphology, flooding hazards, GW potential, land use etc. are used.

Table 5: Choice of Methods for Impact Modeling: Biological Environment *

Name	Relevance	Application	Remarks
Flora			
Sample plot methods	Density and relative density Density and relative dominance	Average number of individuals species per unit area Relative degree to which a species predominates a community by its sheer numbers, size bulk or biomass	The quadrant sampling technique is applicable in all types of plant communities and for the study of submerged, sessile (attached at the base) or sedentary plants
	Frequency and relative frequency importance value	Plant dispersion over an area or within a community	Commonly accepted plot size: 0.1 m ² - mosses, lichens & other mat-like plants
		Average of relative density, relative dominance and relative frequency	0.1 m ² - herbaceous vegetation including grasses
			10.20 m ² – for shrubs and saplings up to 3m tall, and
			100 m ² – for tree communities
Transects & line intercepts methods	Cover	Ratio of total amount of line intercepted by each species and total length of the line intercept given its cover	This methods allows for rapid assessment of vegetation transition zones, and requires minimum time or equipment of establish
	Relative dominance	It is the ratio of total individuals of a species and total individuals of all species	Two or more vegetation strata can be sampled simultaneously
Plot-less sampling methods	Mean point plant Mean area per plant	Mean point – plant distance Mean area per plant	Vegetation measurements are determined from points rather than being determined in an area with boundaries
	Density and relative		Method is used in grass-land

Name	Relevance	Application	Remarks
	density		and open shrub and tree communities
	Dominance and relative dominance		It allows more rapid and extensive sampling than the plot method
	Importance value		Point-quarter method is commonly used in woods and forests.
Fauna			
Species list methods	Animal species list	List of animal communities observed directly	Animal species lists present common and scientific names of the species involved so that the faunal resources of the area are catalogued
Direct Contact Methods	Animal species list	List of animals communities observed directly	This method involves collection, study and release of animals
Count indices methods (Roadside and aerial count methods)	Drive counts Temporal counts	Observation of animals by driving them past trained observers	Count indices provide estimates of animal populations and are obtained from signs, calls or trailside counts or roadside counts
	Call counts	Count of all animals passing a fixed point during some stated interval of time	These estimates, through they do not provide absolute population numbers, Provide an index of the various species in an area
			Such indices allow comparisons through the seasons or between sites or habitats
Removal methods	Population size	Number of species captured	Removal methods are used to obtain population estimates of small mammals, such as, rodents through baited snap traps
Market capture methods	Population size estimate (M)	Number of species originally marked (T) Number of marked animals recaptured (t) and total number of animals captured during census (n) $N = nT/t$	It involves capturing a portion of the population and at some later date sampling the ratio of marked to total animals caught in the population

Table 6: Choice of Methods for Impact Predictions: Socio-economic Aspect *

Name	Application	Remarks
Extrapolative Methods	A prediction is made that is consistent with past and present socio-economic data, e.g. a prediction based on the linear extrapolation of current trends	
Intuitive Forecasting (Delphi techniques)	Delphi technique is used to determine environmental priorities and also to make intuitive predictions through the process of achieving group consensus	Conjecture Brainstorming Heuristic programming Delphi consensus
Trend extrapolation	Predictions may be obtained by extrapolating present	Trend breakthrough precursor

Name	Application	Remarks
and correlation	trends Not an accurate method of making socio-economic forecasts, because a time series cannot be interpreted or extrapolated very far into the future with out some knowledge of the underlying physical, biological, and social factors	events correlation and regression
Metaphors and analogies	The experience gained else where is used to predict the socio-economic impacts	Growth historical simulation commonsense forecasts
Scenarios	Scenarios are common-sense forecasts of data. Each scenario is logically constructed on model of a potential future for which the degrees of “confidence” as to progression and outcome remain undefined	Common-sense
Dynamic modeling (Input-Out model)	Model predicts net economic gain to the society after considering all inputs required for conversion of raw materials along with cost of finished product	
Normative Methods	Desired socio-economic goals are specified and an attempt is made to project the social environment backward in time to the present to examine whether existing or planned resources and environmental programmes are adequate to meet the goals	Morphological analysis technology scanning contextual mapping - functional array - graphic method Mission networks and functional arrays decision trees & relevance trees matrix methods scenarios

* **NOTE:** (i) If a project proponent prefer to use any model other than listed, can do so, with prior concurrence of concerned appraisal committee. (ii) Project-specific proposed prediction tools need to be identified by the project proponent and shall be incorporated in the draft ToR to be submitted to the Authority for the consideration and approval by the concerned EAC/SEAC.

ANNEXURE XIV

**Form through which the State Governments/Administration of
the Union Territories Submit Nominations for SEIAA and SEAC
for the Consideration and Notification by the
Central Government**

Form for Nomination of a professional/expert as Chairperson / Member / Secretary of the SEIAA / EAC / SEAC						
1 Name (in block letters)						
2 Address for communication						
3 Age & Date of Birth (Shall be less than 67 years for the members and 72 years for the Chairman)						
4 Area of Expertise (As per Appendix VI)						
5	Professional Qualifications (As per Appendix VI)	Qualification(s)	University	Year of passing	Percentage of marks	
6	Work experience (High light relevant experience as per Appendix VI)	Position	Years of association		Nature of work. If required, attach separate sheets	
			From	to		Period in years
7	Present position and nature of job	Serving Central / State Government Office?			Yes/No	
		Engaged in industry or their associations?			Yes/No	
		Associated with environmental activism?			Yes/No	
		If no is the answer for above three, please specify the present position and name of the organization				
8	Whether experienced in the process of prior environmental clearance?	Yes/No. If yes, please specify the experience in a separate sheet (Please restrict to 500 words)				
9	Whether any out-standing expertise has been acquired?	Yes/ No If yes, please provide details in a separate sheet (Please restrict to 500 words).				
10	Any other relevant information?	May like to attach separate sheets (Research projects, consultancy projects, publications, memberships in associations, trainings undergone, international exposure cum experience etc.)				

The Government of.....is pleased to forward the Nomination of Dr./Sh. for the position of Chairperson / Member / Secretary of the SEIAA / SEAC / EAC to the Ministry of Environment & Forests, the Government of India for the Notification.

(Authorized Signature with Seal)

ANNEXURE XV
Composition of EAC/SEAC

Composition of the EAC/SEAC

The Members of the EAC shall be Experts with the requisite expertise and experience in the following fields /disciplines. In the event that persons fulfilling the criteria of “Experts” are not available, Professionals in the same field with sufficient experience may be considered:

- Environment Quality Experts: Experts in measurement/monitoring, analysis and interpretation of data in relation to environmental quality
- Sectoral Experts in Project Management: Experts in Project Management or Management of Process/Operations/Facilities in the relevant sectors.
- Environmental Impact Assessment Process Experts: Experts in conducting and carrying out Environmental Impact Assessments (EIAs) and preparation of Environmental Management Plans (EMPs) and other Management plans and who have wide expertise and knowledge of predictive techniques and tools used in the EIA process
- Risk Assessment Experts
- Life Science Experts in floral and faunal management
- Forestry and Wildlife Experts
- Environmental Economics Expert with experience in project appraisal

ANNEXURE XVI

Best Practices & Latest Technologies available and reference

Best Practices & Latest Technologies available and reference

Coal has an image of being an old-fashioned fuel, due to its use in steam-powered ships and locomotives. While coal-fired power generation is perceived a major factor in CO₂ emissions leading to global warming, the technology is changing. In fact, Hitachi's technology, supported by customer cooperation, is changing this image with higher efficiency and environmental development in the thermal power field.

Coal-fired power generation is garnering renewed interest

Thermal power is generally classified into three categories based on the type of fuel, known as liquefied natural gas (LNG), petroleum and coal. While petroleum used to be used as fuel in most situations, the utilization ratios of LNG and coal have increased since the first oil crisis of 1973 as petroleum use has decreased over the years.

In 2004, statistics indicated that in Japan petroleum makes up only 10% of power usage, while LNG makes up 26% and coal 25%. The use of coal-fired power generation is expected to increase with a long-term future in Japan as coal reserves are enormously larger than that of LNG or petroleum. In fact, it is estimated that coal mining will continue for at least another 150 years. Additionally, the consistency and global availability of coal is ample and therefore less likely to cause the type of political issues that exist around the petroleum supply. In addition, coal will continue to be an essential source of energy mainly because of its price, which is more stable than petroleum.

New Technologies in Thermal Plant:

While CO₂ emissions are unavoidable when using coal-fired power generation for electricity due to its nature as a fossil fuel, it is undeniable that it is a major factor in global warming. In addition, coal-fired power generation can be problematic because it does emit the largest volume of CO₂ for power generation using fossil fuels.

However, it's worth considering that a reduction in CO₂ emissions from coal-fired power generation will have a dramatic effect on the prevention of global warming. Since coal-fired power generation must continue to be a leading global power generation method; Hitachi is addressing this important issue. Hitachi has developed the world's leading supercritical pressure and ultra-supercritical pressure coal-fired power generation technologies (*1). These new technologies are expected to contribute to the reduction of CO₂ emissions by achieving more efficient coal-fired power generation.

1) Mechanism to achieve higher efficiency in coal-fired thermal power generation given by HITACHI, Japan

The efficiency of coal-fired power generation is primarily dependent on when the steam generated from the boiler and the combustion of coal is at a more elevated temperature and pressure. However, the strength of the boiler decreases when used at high temperatures and pressure for long periods of time.

In an effort to solve this problem, Hitachi has reviewed the design by focusing on strength and heat transmission, and developed high-strength steel. Hitachi has also established ultra-supercritical pressure power generation technology, which is able to withstand high temperatures in the (600 degrees) class and high pressure (25MPa, about 250 times greater than atmospheric pressure). This approach is resulting in the reduction of CO₂ emissions by 7% in ultra-supercritical pressure power generation, compared with current sub-critical pressure power generation.

Coal-fired power generation in Japan is operated with a total efficiency rate of 40% or more, the highest rate in the world. This is due to the recent widespread utilization of supercritical pressure and ultra-supercritical pressure power generation. Moreover, Hitachi has promoted the development of technology at higher temperatures and pressure (in the 700 degrees). In an effort to curb the effects of global warming, Hitachi is applying a practical application of coal gasification power generation and the development of oxygen-burning coal-fired thermal power.

The Hitachi Group views the Supercritical Pressure Coal-Fired Thermal Power Plant as one of the ways we can achieve our Environmental Vision 2025, with a goal of helping to reduce annual CO₂ emissions by 100 million tons by 2025 through our products and services.

II) Solar Thermal Power Plants: Proven and ready for market

SCHOTT would like to make a contribution to achieving this goal: the “SCHOTT Memorandum on Solar Thermal Power Plant Technology” is designed to familiarize decision makers in politics and economy with the technology and to initiate the necessary steps for market launch.

With high efficiency and the lowest energy production costs of all kinds of solar power plants, the parabolic trough solar thermal power plant represents the goals of profitability, reliable power supply, and environmental protection. Parabolic trough power plants are suitable for industrial scale applications in the range of 50 to 200 MW of electrical power. They can replace conventional power plants designed for medium-load operation and without any qualitative change in the network structure.

Of the various solar thermal power plant technologies, only parabolic trough technology has yet achieved market maturity. Therefore the statements on solar thermal power plant technology in this memorandum are based on this technology. They have been reinforced through operational practice.

In the solar field of a parabolic trough power plant, parabolic mirrors placed in long rows concentrate solar irradiation 80 times upon an absorber tube, in which a heat transfer fluid is heated. In the central generation unit, a heat exchanger produces steam to power the turbines.

How parabolic trough power plants work

Solar thermal power plants are basically power plants, which generate electricity from high-temperature heat. The difference between them and conventional power plants: not gas, coal, or oil, but the sun provides the energy that drives the turbines. In the solar field of the power plant, parabolic mirrors lined up in long rows concentrate the solar irradiation 80 times on an absorber tube, in which special oil used as heat transfer medium is heated to about 400 OC. In the central generating unit, a heat exchanger then generates steam, which powers the conventional steam turbines.

Modern storage technology makes solar power available during unfavorable weather and at night: the millions of liters of heat transfer fluid circulating in the solar field already represent a considerable storage capacity, which can bridge short-term cloudy phases. Molten salt storage tanks provide for additional reliable power supply around the clock. Applying storage technology ensures that the turbines can always run at full load and thus with optimal efficiency. That makes the power plant more profitable.

Molten salt storage tank technology is proven and has been rated as reliable by common carriers. The Spanish national carrier has therefore given the power plant setup described here the same reliability status as fossil fuel power plants. It sees no problem in integrating such power plants in existing networks.

The construction of **hybrid power plants** is possible: since solar fields feed their heat energy into a conventional steam turbine, they can, for example, be integrated with ease in the relatively clean natural-gas-fired combined- cycle power plants of the latest generation. It is also possible to retrofit existing conventional steam power plants with parabolic trough solar fields as an additional solar steam generator. Hybrid technology means:

- Improved utilization of the turbines and thus optimal operation of the entire power plant block,
- Favorable power prices based on a mixed calculation,
- In comparison to molten salt storage technology, a more cost-effective buffering of fluctuations in the solar radiation by using of auxiliary heating with fossil fuels,
- Gentler entry into the power plant park consisting predominantly of fossil power plants,
- The opportunity for ecological enhancement of fossil power plants.

Hybrid technology leads to a great improvement in competitiveness against conventional power plants. Substantial cost advantages result even from auxiliary heating with fossil fuels at SEGS power plants (solar energy generating system), as operated at the California power plants. The power production costs are cut in half for ISCCS power plants (integrated solar combined-cycle system). In ISCCS power plants, parabolic trough fields are combined with modern gas-fired combined-cycle power plants. Here the power production costs are just slightly higher than those of conventional power plants, even without subsidies. Solar

thermal hybrid power plants are thus an important link between today's fossil fuel and tomorrow's solar power supply.

These advantages have moved the Global Environmental Facility (GEF) to provide subsidies in the amount of 200 million US dollars exclusively for gas and steam/solar hybrid power plants. The ability to be combined with conventional power plants substantially increases the market opportunities also in the USA. Currently large-scale investments are being made there in new generation gas power plants. In Algeria, too, plans call for the use of auxiliary solar power as an enrichment for gas-generated power systems.

Parabolic trough power plants can be operated in cogeneration plants for heat and power, for example to produce drinking water with a sea water desalination system. In cogeneration systems, solar efficiencies of up to 55 percent are achievable.

Solar thermal power plant technology is available in Europe: substantial solar resources are usable on the southern edge of the EU (Andalusia, Sicily, Malta, the Greek islands, Cyprus); and practically inexhaustible resources are available at technically feasible distances in North Africa. The transmission costs from this area to Central Europe are around 2 cent per KWh.

Proven technology: Nine of the power plants of the first generation built in California in the 1980's have proven their long-term capabilities and reliability: 200,000 households have been supplied continuously with electricity for over 15 years. So far, they have generated about fifty percent of the solar power generated worldwide.

Parabolic trough technology has now entered a phase of constant optimization. The operating costs have dropped from originally 8 cent/KWh to just over 3 cent/KWh. Experience provided the basis for development of a new generation of parabolic trough components with substantially improved performance. Due to the inexhaustible energy potential of the sun, technical performance, and environmental friendliness, solar thermal power plant technology is in a position to make an essential contribution to future power supply. **It is ready for worldwide use.**

Advantages of solar thermal power plant technology

- Parabolic trough power plants are suitable for large-scale use in the range of 10 to 200 MWe_{el} electrical output. The modular character of the solar field makes it possible to start at any power level. Currently the optimal size is 150 - 200 MWe_{el}. Parabolic trough power plants can replace conventional thermal power plants - and without any qualitative changes in the grid structure.
- Due to the option of thermal storage, the turbines of solar thermal power plants can also produce power in low-radiation periods and at night. Solar thermal power plants can deliver power reliably, on a planned schedule, and in a way that keeps the grids stable.

- Solar thermal power generation can be combined with conventional thermal power plants. Combined utilization leads to substantial cost reductions and thus facilitates entry into the use of renewable energies, particularly for threshold countries.
- Depending on local irradiation, parabolic trough power plants can now produce cost-effective solar power at prices between 10 and 20 cent/KWh. The high costs of the investment phase are balanced by low operating costs of currently only 3 cent/KWh. By 2015 the power production costs will be comparable to those of medium-load power plants using fossil fuels.
- The use of solar energy means reliable planning. The independence of the operating costs from fluctuating fuel prices and unlimited availability permit reliable calculation throughout the entire investment period.
- Particularly in the sunbelt when most power is needed for cooling, solar thermal power plant technology is most effective. These power peaks are already covered competitively today by the nine solar thermal power plants in California.
- High-voltage DC transmission lines, which are currently state-of-the-art, can conduct the power over long distances - for example from North Africa to Central Europe. The costs are around 2 cent/KWh.
- Parabolic trough power plants are a proven technology. In the USA, the power plants of the first generation are running reliably with a total capacity of 354 MWeI. With nearly 12 terawatt hours of solar power produced at a value of 1.6 billion dollars, parabolic trough technology has demonstrated its potential impressively. In nearly 20 years of operation, no disadvantageous effects on the social or the fragile natural environment have become known.
- Solar thermal power plants use low-cost, recyclable materials that are available worldwide: steel, glass, and concrete. Local companies handle a great share of the construction work. The modular structure of the solar field facilitates entry into mass production with substantial potential for increased efficiency.
- Solar thermal power plants have a very good ecological balance. The energy payback time of five months is low - even in comparison to other regenerative energies. Parabolic trough technology has the lowest material requirements of all solar thermal power plant technologies.
- The land use of solar thermal power plants is substantially lower than for biomass, wind energy, or water power - not to mention dams in mountains. In addition, since they are erected only in the dry zones of the Earth, there is hardly any competition for land utilization. Solar thermal power plants can be used in the Earth's sunbelt between 35° northern and southern latitude.

- Parabolic trough power plants are ideally suited for “Joint Implementation” (JI) and “Clean Development Mechanism” (CDM) projects under the Kyoto Agreement. Industrial and developing countries can work together on parabolic trough power plant projects to make power generation decisively more environmentally friendly and thus protect our planet's climate.
- The waste heat of solar thermal power plants can be used for sea water desalination as well as for electricity generation. Particularly countries in North Africa and the Middle East, which are outstanding locations for solar thermal power plant technology, could improve their water supply by this means.

Diagram

of a solar thermal power plant with heat storage system: In the solar field, transfer fluid is heated, and then flows to a heat exchanger. There steam is produced, which powers the turbines. If needed, a heat storage tank can be added to the cycle.

Conclusion:

Power plants are part of infrastructure society and it is essential that these power plant facilities are constructed so as achieve a higher level of reliability. Moreover, it is for the companies involved in this industry to contribute to society by realizing higher performance at lower cost and good technology.
